

Context-dependent substitution models,
molecular clocks,
and the arrow of time

Gerton Lunter

Budapest, June 2008

Evidence for a High Frequency of Simultaneous Double-Nucleotide Substitutions

Michalis Averof,^{1*} Antonis Rokas,² Kenneth H. Wolfe,³

**PROBABILISTIC MODELS OF DNA SEQUENCE EVOLUTION
WITH CONTEXT DEPENDENT RATES OF SUBSTITUTION**

JENS LEDET JENSEN,* *Aarhus University*

ANNE-METTE KRABBE PEDERSEN,** *Aarhus University*

Model:

nnnnn**abc**nnnnn \rightarrow nnnnn**ab'**cnnnnn: Rate $\lambda(a,b,b',c)$

Proposition:

The process is **reversible**, with a stationary distribution that has a (first order) **Markov structure**, iff λ can be written as

$$\lambda(a,b,b',c) = \exp [\varphi(a,b',c) + \Psi(a,b,b',c)]$$

with Ψ symmetric in b and b' .

Phylogenetic Estimation of Context-Dependent Substitution Rates by Maximum Likelihood

Adam Siepel* and David Haussler*†

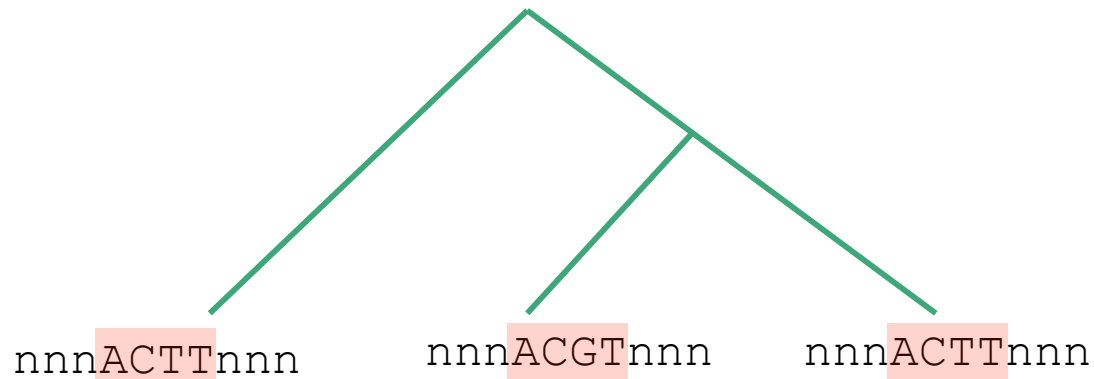

Mol. Biol. Evol. 21(3):468–488, 2004

Model: Rates depend on both neighbouring nucleotides
Double mutations forbidden

Inference: “sliding window” approximation

$$P(x_{\bullet} | \Psi) = \prod_{i=N}^L P(x_{\bullet,i} | x_{\bullet,i-N+1}, \dots, x_{\bullet,i-1}, \Psi)$$

$$P(x_{\bullet,i} | x_{\bullet,i-N+1}, \dots, x_{\bullet,i-1}, \Psi) = \frac{P(x_{\bullet,i-N+1}, \dots, x_{\bullet,i-1}, x_{\bullet,i} | \Psi)}{\sum_{\tilde{x}_{\bullet,i}} P(x_{\bullet,i-N+1}, \dots, x_{\bullet,i-1}, \tilde{x}_{\bullet,i} | \Psi)}$$

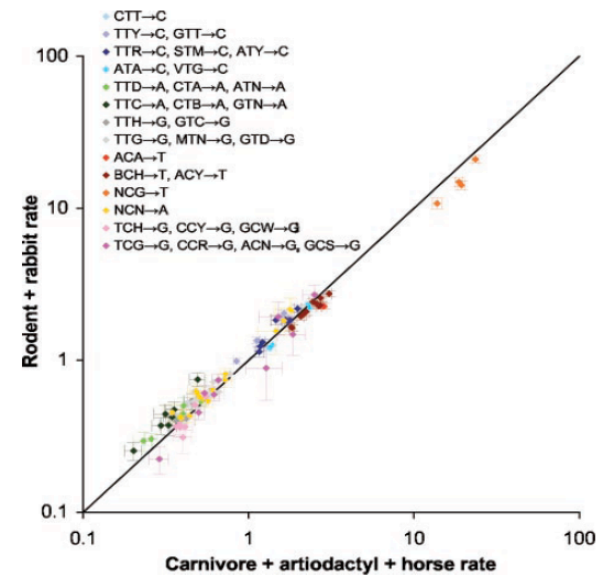

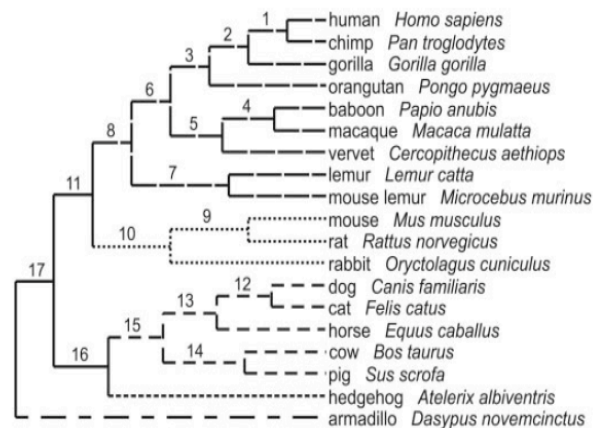

Bayesian Markov chain Monte Carlo sequence analysis reveals varying neutral substitution patterns in mammalian evolution

Dick G. Hwang*[†] and Phil Green*^{†‡}

Model: Rates depend on both neighbouring nucleotides
Double mutations forbidden

Inference: Bayesian MCMC
Discretized time; one mutation per time-slice

Bayesian Markov chain Monte Carlo sequence analysis reveals varying neutral substitution patterns in mammalian evolution

Dick G. Hwang*[†] and Phil Green*^{†‡}

Discussion

Context dependent effects: **Should We Bother?**

Yes:

- CpG effects are real, and strong (15 x mean background)
- CpG mutations are implicated in genetic disorders
- Cause of mutational inhomogeneity, particularly at short distances
- Possibly most clock-like signal we have for mammals?

No:

- Inclusion complicates model tremendously
- Makes very small difference in likelihood: don't bother for alignments!
- Does it influence gene finding; motif evolution; phylogenetic inferences?
