RESUME. — Nous étudions la limite thermodynamique du modèle hiérarchique de Dyson vectoriel invariant par rotation à basse température. Ce modèle dépend d’un paramètre $c$ qui joue un rôle analogue à la dimension. Le cas $\sqrt{2} < c < 2$ a été étudié dans [5] et nous considérons ici le cas $1 < c < \sqrt{2}$ qui donne des limites thermodynamiques non gaussiennes.

Dans la première partie nous étudions l’action de la renormalisation sur ce modèle, et nous établissons la convergence pour des normalisations non triviales. Dans la seconde partie nous étudions la limite thermodynamique de l’état de Gibbs en imposant un petit champ magnétique que nous faisons tendre vers zéro avec le volume.

1. INTRODUCTION

First we formulate the problem we are investigating. We consider Dyson's hierarchical vector valued model which is defined in the following way: Put $\mathbb{Z} = \{1, 2, \ldots\}$ and define the hierarchical distance $d(\cdot, \cdot)$ on $\mathbb{Z}$ by the formula

$$d(i,j) = \begin{cases} 0 & \text{if } i = j \\ 2^{m(i,j) - 1} & \text{if } i \neq j \end{cases} \quad (1.1)$$

Annales de l'Institut Henri Poincaré - Physique théorique
with \( n(i,j) = \{ \min n, \text{there is an integer } k \text{ such that } (k-1)2^n < i, j \leq k2^n \} \).

We call a sequence \( \sigma = \{ \sigma(i), i \in \mathbb{Z} \} \) a configuration, and assume in this work that \( \sigma(i) \in \mathbb{R}^p \) with some \( p \geq 2 \) for all \( i \in \mathbb{Z} \). In order to define our model we introduce the following Hamiltonian function \( \mathcal{H}(\sigma) \) in the space of configurations

\[
\mathcal{H}(\sigma) = - \sum_{i \in \mathbb{Z}} \sum_{j \geq i} U(i,j) \sigma(i) \sigma(j) \quad (1.2)
\]

\[
U(i,j) = d(i,j)^{-a} \quad \text{if} \quad i \neq j,
\]

where \( a, 1 < a < 2 \), is a parameter of the model, and \( \sigma(i) \sigma(j) \) denotes scalar product. (In the sequel we shall use \( c = 2^{2-a} \) instead of the parameter \( a \).)

We also introduce the function

\[
\mathcal{H}_n(\sigma) = \sum_{i=1}^{2^n} \sum_{j=i+1}^{2^n} U(i,j) \sigma(i) \sigma(j), \quad \sigma = \{ \sigma(1), \ldots, \sigma(2^n) \} \quad (1.2)'
\]

and a free measure \( \nu \) on \( \mathbb{R}^p \) defined by the formula

\[
\frac{d\nu}{dx} = p(x) = p(x, t) = C(t) \exp \left\{ - \frac{x^2}{2} - \frac{t}{4} |x|^4 \right\} \quad (1.3)
\]

where \( t > 0 \) is a sufficiently small fixed constant. It is another parameter of the model. The constant \( C(t) \) is chosen in such a way that \( p(x) \) be a density function.

Dyson has introduced such a model in [12] and [13]. It is a simplified version of one-dimensional Ising type models with long range interaction. Many physical phenomena can be studied more simply in this model. Dyson introduced it to study phase transitions and Thouless effect. Later it became clear that this model is also very appropriate to study renormalization type problems (see [6], [8], [9]). The aim of the present work is also to study a renormalization type problem. We want to understand the consequences of continuous symmetry in renormalization type problems.

There is a standard way to define equilibrium states at temperature \( T \) for a model with Hamiltonian \( \mathcal{H} \) and free measure \( \nu \) (see e.g. [19], [20]). For the sake of completeness we recall it in Appendix D. In Appendix E we also prove that the measure constructed in Part II is an equilibrium state. In this work we are mainly interested in the large-scale limit of the equilibrium state of Dyson's model. The notion of large-scale limit is defined in many places, e.g. in [20] or at the beginning of Part II of this work. (In Part I this notion does not appear yet.) In Section 7 of [6] it is pointed out that the large-scale limits in Dyson's model are essentially different in the case \( \sigma(i) \in \mathbb{R}^1 \) and in the vector-valued case \( \sigma(i) \in \mathbb{R}^p, p \geq 2 \).
Moreover, in the vector valued case the situations $1 < c < \sqrt{2}$ and 
$\sqrt{2} < c < 2$ also differ. The large-scale limit in the case $\sqrt{2} < c < 2$ is

described in [5]. The corresponding result for the case $1 < c < \sqrt{2}$ is
formulated in [6] with a sketch of proof. (The case $c = \sqrt{2}$ deserves special
attention, but we are going to investigate it elsewhere.) The aim of the
present work is to give a rigorous proof of the result about the model with
$1 < c < \sqrt{2}$ on the basis of the ideas of [6]. During the proof we had to
overcome several technical difficulties which we found interesting in
themselves. The proof can be split up into the solution of two analytical
problems which are fairly independent. In the first part of this work we
study the first of them which deals with the behaviour of Gibbs states
without boundary conditions. (See Appendix D for explanation of this
terminology.) The most essential differences between cases $1 < c < \sqrt{2}$
and $\sqrt{2} < c < 2$ appear at this point.

The first problem can be formulated directly, and it has a special interest.
For all $n$, $n = 0, 1, 2, \ldots$ and $T > 0$ consider the probability measure
$\mu_n = \mu_{n,T}$ on $(\mathbb{R}^p)^{2^n}$ with the density function

$$p_n(x_1, \ldots, x_{2^n}) = p_n(x_1, \ldots, x_{2n}, T, t), \quad x_j \in \mathbb{R}^p$$

defined by the formula

$$p_n(x_1, \ldots, x_{2^n}) = \frac{1}{Z_n(T, t)} \exp \left\{ -\frac{1}{T} \sum_{i=1}^{2^n} \sum_{j=i+1}^{2^n} U(i,j)x_i x_j \right\} \prod_{i=n}^{2^n} p(x_i, t)$$

(1.4)

where $U(i,j)$ is defined by formulas (1.1) and (1.2), $p(x, t)$ by (1.3) and
$Z_n(T, t)$ is an appropriate norming constant with which $p_n(x_1, \ldots, x_{2^n})$ is
a probability density function. Let $(\sigma(1), \ldots, \sigma(2^n))$ be a
$\mu_{n,T}$ distributed random vector, and let $p_n(x, T) = p_n(x, T, t)$ denote the density function
of the average $\frac{1}{2^n} \sum_{j=1}^{2^n} \sigma(j)$. We are interested in the asymptotic behaviour
of $p_n(x, T)$ as $n \to \infty$. Let us remark that $p_n(x, T)$ depends on $x$ only through $|x|$, i.e. if we define the function $\bar{p}_n(y, t)$, $y \in \mathbb{R}^1$ as $\bar{p}_n(y, t) = p_n(y, 0, t)$,
$0 = (0, \ldots, 0) \in \mathbb{R}^{p-1}$ then $p_n(x, t) = \bar{p}_n(|x|, T)$. Now we formulate Theorem 1, the main result of Part I. Its main content is that for $1 < c < \sqrt{2}$
the density function $p_n(x, T)$ satisfies a limit theorem with an unusual
normalization. The limit distribution is not normal, its density is defined
by an integral equation. Theorem 2 also contains some information about
the smoothness of the functions $p_n(x, T)$ and their decrease at infinity.

Theorem 1. — For $1 < c < \sqrt{2}$ there exist some $T_0 > 0$ and $t_0 > 0$ such

Annales de l'Institut Henri Poincaré - Physique théorique
that for all $0 < T < T_0$ and $0 < t < t_0$ there are some $M = \bar{M}(c, t, T) > 0$ and $n_0 = n_0(c, t, T)$ such that for $n > n_0$

$$c^{-n}p_n(x, T) = c^-\bar{p}_n(|x|, T) = B(M, T)\exp\left(-\frac{a_0 c^n}{T} |x| - \bar{M}|x| - M\right) + r_n(x) \quad (1.5)$$

with $a_0 = \frac{2}{2 - c}$ and $a_1 = a_0 + 1$, where $B(M, T) > 0$ is an appropriate norming constant, the function $g(x)$ is the solution of the integral equation

$$g(x) = \left(\frac{2}{c\sqrt{n\pi}}\right)^{p-1} \int_{\mathbb{R}^{p}} \exp(-v^2)g\left(\frac{x}{c} + u + \frac{v^2}{2}\right)g\left(\frac{x}{c} - u + \frac{v^2}{2}\right) \, du \, dv \quad (1.6)$$

where $u \in \mathbb{R}^1$, $v \in \mathbb{R}^{p-1}$, $v^2$ denotes scalar product, and the error term $r_n(x)$ satisfies the inequality

$$|r_n(x)| \leq K(M, T)q^n \quad \text{for all } x \geq 0$$

with some $K(M, T) > 0$ and $0 < q < 1$, where $q$ depends only on the parameter $c$, $1 < c < \sqrt{2}$.

The equation (1.6) has a unique solution in the class of functions

$$\mathcal{A} = \left\{ g(x), \int e^x |g(x)| \, dx < \infty \text{ if } |t| < t_0(g), t_0(g) > 0 \right\}$$

beside the trivial one $g(x) \equiv 0$, and this function appears in formula (1.6). It also satisfies the relation $g(x) > 0$ for all $x$, and $\exp(-a_0x)g(a_1x) < K(\alpha)\exp(-\alpha|x|)$ for all $x \in \mathbb{R}^1$ if $\alpha < \frac{6c - 4}{c(2 - c)}$.

The functions $\bar{p}_n(x, T)$ and $r_n(x)$ also satisfy the inequalities

$$\left| \frac{d^j}{dx^j} c^{-n}\bar{p}_n(x, T) \right| \leq c^{n_j}K(M, T)\exp\left(-\frac{\mu c^n}{T}|x| - \bar{M}|x|\right) \quad \text{for all } x > 0$$

$$j = 0, 1, 2, \quad n > n_0 \quad (1.7)$$

$$\left| \frac{d^j}{dx^j} r_n(x) \right| \leq c^{n_j}K(M, T)q^n, \quad j = 0, 1, 2 \quad \text{for all } x > 0, \quad n > n_0 \quad (1.8)$$

with some $K(M, T) > 0$, $\mu > 0$ and $0 < q < 1$, where $\mu$ and $q$ depend only on the parameter $c$.

The number $\bar{M}$ satisfies the relation

$$\bar{M}^2 = \frac{a_0 - T}{tT} + R(T, t) \quad (1.9)$$

with some $|R(T, t)| \leq \text{const.}$ such that $R(T, t) \to 0$ if $T \to 0$ and $t \to 0$.
We shall prove (Lemma 12) that the function $g(x)$ is the density function of an appropriately defined quadratic form of independent normal variables.

Theorem 1 means in particular that in the case $1 < c < \sqrt{2}$ if $(\sigma(1), \ldots, \sigma(2^n))$ is a $\mu_{n,T}$ distributed random vector then the density functions of the random variables $\frac{c^n}{2n} \sum_{j=1}^{2n} \sigma(j) \left| - c^n \bar{M} \right| \text{tend to the density function}$

$$\text{const. exp} \left( - \frac{a_0}{T} M x \right) g \left( \frac{a_1}{T} M x \right) \quad \text{as} \quad n \to \infty.$$  

The behaviour of Dyson’s model in the case $\sqrt{2} < c < 2$ or with scalar valued spins is essentially different. In these cases the random vectors $2 \left( \frac{n}{2} \right)^{2n} \sum_{j=1}^{2n} \sigma(j) \left| - 2^2 \bar{M}_n \right|$ tend in distribution to a normal law with zero expectation, $M_n \to \bar{M}$ with some $\bar{M}$ if $M_n = E | \sigma(j) |$ (expectation is taken with respect to the measure $\mu_{n,T}$). (See [5] Appendix, [6] and [9].) This means that in these two cases we have to normalize differently.

In Part II of this work we show that this difference is also inherited in the behaviour of equilibrium states. Moreover, we describe the large-scale limit of the equilibrium state, and show that its component in the direction of the magnetization is a quadratic functional of a Gaussian field.

Let us remark that in our model both the Hamiltonian function $H(\sigma)$ and the free measure $\nu(\sigma)$ defined in (1.2) and (1.3) remain invariant if all spins $\sigma(j), j \in \mathbb{Z}$, are rotated in the same way. Such an invariance is called an $O(p)$ continuous symmetry in the physics literature. Actually this continuous symmetry is the cause of the results in our model. The real problem we are going to study is the consequences of continuous symmetries. We expect that results analogous to those of this paper also hold for translation invariant models with a continuous symmetry on the three dimensional lattice. We formulate this conjecture in a more explicit form in the second part of this work.

In that part we need some more information about the behaviour of the function $p_n(x, T)$ than that given in Theorem 1. Hence we prove the following

**Theorem 2.** — Under the conditions of Theorem 1 there exist some integer $n_0$ and positive real numbers $c, q, B, K, L$ and $\delta$ depending on the parameters $c, T$ and $t$ in such a way that for $n > n_0$

$$c^{-n} p_n(x, T) = B \exp \left( - \frac{a_0 c^n}{T} \bar{M}(x - \bar{M}) \right) g \left( \frac{a_1 c^n}{T} \bar{M}(x - \bar{M}) \right) (1 + r_n(x)) \quad (1.10)$$

Annales de l’Institut Henri Poincaré - Physique théorique
with some $|r_n(x)| < Kq^n$, $0 < q < 1$, in the interval $-\varepsilon n^{-n} < x - \bar{M} < \varepsilon n^{1/2} e^{-n}$, where

$$\alpha = \frac{\log 2}{\log c},$$

and

$$c^{-n}\bar{p}_n(x, T) < Kq^n \exp \left( - L(e^n | x - \bar{M} |)^{2+\delta} \right) \quad (1.11)$$

if $x > \bar{M} + \varepsilon n^{1/2} e^{-n}$.

Relation (1.10) can be considered as the multiplicative version of relation (1.5). In order to deduce it from (1.5) we have to give a good lower bound on $c^{-n}\bar{p}_n(x, T)$ in the interval $-\varepsilon n^{-n} < x - \bar{M} < \varepsilon n^{1/2} e^{-n}$. The main content of formula (1.11) is that for $x \gg \bar{M}$ a much sharper upper bound can be given than that in (1.7). On the other hand for $0 < x < \bar{M}$ the bound in (1.7) cannot be improved considerably, at most a better constant $\mu$ can be written in the exponent.

The appearance of the number $\alpha = \frac{\log 2}{\log c}$ has a deeper reason. The decrease of the limit function $g(x)$ at plus infinity is of order $\exp \left( - \text{const} |x|^\mu \right)$. The size of the typical region where the good asymptotic formula (1.10) is proved is also connected with the tail behaviour of the limit function. This typical region is chosen in such a way that the density function $\bar{p}_n(x, T)$, after an appropriate scaling, is exponentially small outside of this region. (Observe the term $q^n$, $q < 1$, in formula (1.11).) The typical region is not symmetric with respect to the origin, because the decrease of the function $\bar{p}_n(x, T)$ is different for positive and negative arguments. For negative $x$ formula (1.7) gives a good bound on $\bar{p}_n(x, T)$ outside of the typical region.

In Theorems 1 and 2 we have assumed that the free measure $v$ is defined by (1.3). We could have considered a more general class of free measures. Theorems 1 and 2 can be proved without any essential change if

$$\frac{dv}{dx} = p(x, t) = C(t) \exp \left( - \frac{x^2}{2} - \frac{t}{4} |x|^4 + R(x, t) \right)$$

with some function $R$ such that $\left| \frac{\partial^j R}{\partial x^j} \right| < Ct^{1+x} |x|^{4-j}$ with some $C > 0, j = 0, 1, 2, 3, 4$.

2. ON THE CONTENT OF THEOREM 1. CONVERGENCE TO THE SOLUTION OF THE FIXED POINT EQUATION

It is proved e.g. in Section 4 of [6] that the function $p_n(x, T)$ defined in Section 1 satisfies the recursive relations

$$p_n(x, T) = C_n(T) \int \exp \left( \frac{e^{n-1}}{T} (x^2 - u^2) \right) p_{n-1}(x-u, T) p_{n-1}(x+u, T) du \quad (2.1)$$

$$p_0(x, T) = p_0(x) = C(t) \exp \left\{ - \frac{x^2}{2} - \frac{t}{4} x^{4} \right\} \quad (2.1')$$
where $C(t)$ and $C_n(T)$ are appropriate norming constants which turn $p_n$ into a density function. (These are formulas (4.2) and (4.2)' in [2]. For the sake of completeness we also present their proof in Appendix A.) Thus Theorem 1 actually formulates the properties of the function defined by relations (2.1) and (2.1)', and we have to study these formulas. We can simplify them a little by introducing the functions

$$q_n(x, T) = B_n \exp \left( \frac{a_0}{2a_1} e^{a_1^2 x^2} \right) p_n \left( \sqrt{\frac{T}{a_1}} x, T \right), \quad a_0 = \frac{2}{2-c^2}, \quad a_1 = a_0 + 1, \quad (2.2)$$

with some constant $B_n$ to be defined later.

A straightforward calculation shows that (2.1) and (2.1)' imply that

$$q_n(x, T) = \bar{C}_n(T) \int_{R^p} \exp \left( -c^{n-1} u^2 \right) q_{n-1}(x-u, T) q_{n-1}(x+u, T) du, \quad (2.3)$$

$$q_0(x, T) = \bar{C}_0(T) \exp \left( \frac{a_0-T}{2a_1} x^2 - \frac{T^2}{4a_1^2} x^4 \right) \quad (2.3')$$

with some $\bar{C}_n(T) > 0$. Observe that $q_n(x, T)$ is also rotation invariant, i.e.

$q_n(x, T) = \bar{q}_n(|x|, T)$ for the function $\bar{q}_n(z, T) = q_d([z, 0], T), \quad z \in \mathbb{R}^1, \quad 0 = (0, \ldots, 0) \in \mathbb{R}^{p-1}.$

Also the relation $q_n(x, T) = \bar{q}_n(-x, T)$ holds. Choose the constant $B_n$ in (2.2) in such a way that

$$\int_0^\infty \bar{q}_n(x, T) dx = 1. \quad (2.4)$$

Clearly

$$p_n(x, T) = \frac{1}{B_n} \exp \left( -\frac{a_0}{2T} e^{a_1^2 x^2} \right) q_n \left( \sqrt{\frac{T}{a_1}} x, T \right), \quad (2.5)$$

and (2.3) implies that

$$\bar{q}_{n+1}(x, T) =$$

$$= K_n \int \exp \left( -c^2 (u^2 + v^2) \right) \bar{q}_n(\sqrt{(x+u)^2 + v^2}, T) \bar{q}_n(\sqrt{(x-u)^2 + v^2}, T) dudv \quad (2.6)$$

Given the function $\bar{q}_n(x, T)$ we define a number $M_n$ and a function $f_n(x) = f_d(x, T)$ by the formulas

$$M_n = M_n(T) = \int_0^\infty x \bar{q}_n(x, T) dx \quad (2.7)$$

$$f_n(x) = f_n(x, T) = c^{-n} q_n \left( M_n + \frac{x}{c^n}, T \right). \quad (2.7')$$

Annales de l'Institut Henri Poincaré - Physique théorique
Clearly, \( f_n(x) \geq 0, f_n(x - c^n M_n) = f_n(-x - c^n M_n), \int_{-c^n M_n}^{\infty} f_n(x)dx = 1, \)
\[
\int_{-c^n M_n}^{\infty} x f_n(x)dx = 0 \text{ and } \dot{q}_n(x, T) = c^n f_n(c^n(x - M_n), T). \]
The reason for introducing the function \( f_n \) and number \( M_n \) is that we expect that this is the right rescaling of the function \( q_n \) for which \( M_n \to M \) and \( f_n(x) \to g_M(x) \) with some appropriate \( M > 0 \) and \( g_M \) as \( n \to \infty \). (See Section 7 of [6] for a heuristic argument.) We shall prove the following

**THEOREM 1'.** Under the conditions of Theorem 1 the limit \( \lim_{n \to \infty} M_n = M \) exists, and

\[
M^2 = \frac{a_1(a_0 - T)}{t T^2} + R(t, T) \tag{2.8}
\]
with some \( |R(t, T)| \leq \text{const. and } R(t, T) \to 0 \text{ as } T \to 0 \text{ and } t \to 0 \). Moreover, there is some \( n_0 = n_0(c, t, T) \) such that for \( n > n_0 \)
\[
M_n = M + \frac{c}{4(c - 1) M} c^{-n} + \delta(n) \cdot c^{-n}, \quad |\delta(n)| \leq K \cdot c^{-n} \tag{2.8}'
\]
with some \( K = K(c) \). For \( n > n_0 \) there is some \( 0 < q < 1 \) and \( K > 0 \) depending on the parameter \( c \) such that

\[
\left| \frac{d^j}{dx^j} f_n(x, T) - M g \left( M \left( x + \frac{c}{4(c - 1) M} \right) \right) \right| \leq K q^n, \quad j = 0, 1, 2, \quad x > -c^n M_n \tag{2.9}
\]
where \( g(x) \) is the same function as in Theorem 1. We also have

\[
\left| \frac{d^j}{dx^j} f_n(x, T) \right| < K M^{j+1} \exp(-\mu M |x|), \quad j = 0, 1, 2, \quad x > -c^n M_n \tag{2.9}'
\]
for \( n > n_0 \) with some \( \mu > 0 \) and \( K > 0 \) depending only on \( c \).

We shall deduce Theorem 1 from Theorem 1'. In order to study \( f_n \) and \( M_n \) we introduce the integral operators \( \overline{Q}_{n, M} \), \( n = 1, 2, \ldots, M > 0 \) defined for functions \( f \in \mathcal{A}_{n, M} \).

\[
\mathcal{A}_{n, M} = \{ f : \mathbb{R}^1 \to \mathbb{R}^1, f(x) \text{ is continuous, } 0 \leq f(x) \leq K \text{ for all } x \in \mathbb{R}^1, \}
\]
\( f(x) \leq K \exp(-2x) \text{ with some } K = K(f) > 0 \text{ and } \alpha = \alpha(f) > 0 \text{ for } x > 0, \text{ there is some } x > -c^n M \text{ where } f(x) > 0 \} \),

by the formula

\[
\overline{Q}_{n, M} f(x) = \int \exp \left(-\frac{u^2}{c^n} - v^2\right) f \left( c^n \left( \sqrt{M + \frac{x}{c^n+1} + \frac{u}{c^n}} + \frac{v}{c^n} - M \right) \right)
\]
\[
f \left( c^n \left( \sqrt{M + \frac{x}{c^n+1} - \frac{u}{c^n}} + \frac{v^2}{c^n} - M \right) \right) du dv. \tag{2.10}
\]
For the sake of simpler notations we shall restrict ourselves from now on to two-dimensional models, i.e. $\mathbb{R}^p = \mathbb{R}^2$. In this case $u \in \mathbb{R}^1$ and $v \in \mathbb{R}^1$ in (2.10). Observe that $\overline{Q}_{n,M}f(x)$ depends on the values of $f(x)$ only for $x > -c^n M$, and $\overline{Q}_{n,M}f(x) = \overline{Q}_{n,M}f(-x - 2c^{n+1} M)$ what can be seen by applying the substitution $(u, v) \to (-u, -v)$ in the integral defining $\overline{Q}_{n,M}f$. Moreover, $\overline{Q}_{n,M}f \in \mathcal{A}_{n+1,M}$ for $f \in \mathcal{A}_{n,M}$, since $\overline{Q}_{n,M}f(cx) > 0$ if $f(x) > 0$, $0 \leq \overline{Q}_{n,M}f(x) \leq c^n \pi \sup |f(x)|^2$, and we get, by splitting up the domain of integration in (2.10) to $\left\{(u,v), |u| < \frac{x}{2}\right\}$ and $\left\{(u,v), |u| > \frac{x}{2}\right\}$, that for $x > 0$

$$|\overline{Q}_{n,M}f(x)| \leq K^2 c^n \pi \left(\exp\left(-\frac{\alpha}{2c} x\right) + \exp\left(-\frac{x^2}{4c^n}\right)\right) \leq K \exp(-\bar{x}).$$

Put

$$m_n = \int_{-c^{n+1}M}^{\infty} x \overline{Q}_{n,M}f(x) dx,$$

and define the normalization of the operator $\overline{Q}_{n,M}$

$$\overline{Q}_{n,M}f(x) = \frac{\overline{Q}_{n,M}f(x + m_n)}{\int_{-c^{n+1}M}^{\infty} \overline{Q}_{n,M}f(x) dx}$$

for $f \in \mathcal{A}_{n,M}$. (The above formulas are meaningful since $\overline{Q}_{n,M}f \in \mathcal{A}_{n+1,M}$.)

Let us define

$$Q_n(f(x), M) = \left(\overline{Q}_{n,M}f(x), M + \frac{m_n}{c^{n+1}}\right)$$

for $f \in \mathcal{A}_{n,M}$, $M > 0$. We claim that the relation

$$Q_n(f_n(x), M_n) = (f_{n+1}(x), M_{n+1})$$

holds for the functions $f_n$ and numbers $M_n$ defined in (2.7) and (2.7)', and $f_n \in \mathcal{A}_{n,M}$. This can be seen by observing that by (2.6) and the definition of $f_n$

$$\overline{q}_{n+1}\left(M_n + \frac{x}{c^{n+1}}\right) = K_n \int \exp\left(-\frac{u^2}{c^n} - v^2\right)f_n\left(c^n\left(\sqrt{\left(M_n + \frac{x}{c^{n+1}} + \frac{u}{c}\right)^2 + \frac{v^2}{c^n} - M_n}\right)\right) f\left(c^n\left(\sqrt{\left(M_n + \frac{x}{c^{n+1}} + \frac{u}{c}\right)^2 + \frac{v^2}{c^n} - M_n}\right)\right) du dv = K_n \overline{Q}_{n,M_n}f_n(x),$$

Annales de l'Institut Henri Poincaré - Physique théorique
hence
\[ f_{n+1}(x) = Q_{n,M_n}f_n(x) \]  \hspace{1cm} (2.14)
and
\[ M_{n+1} = M_n + \frac{m_n}{c^{n+1}} \]  \hspace{1cm} (2.14')

(The constants K, C, K_n, C_n, etc. will denote appropriate multiplying factors in the sequel. The same letter may denote different numbers in different formulas.)

If \( \frac{X}{c^{n+1}}, \frac{u}{c^n}, \frac{v^2}{c^n} \) are much smaller than M then a simple Taylor expansion yields that
\[
c^n \left( \sqrt{\left( M + \frac{X}{c^{n+1}} \pm \frac{u}{c^n} \right)^2 + \frac{v^2}{c^n} - M} \right) =
\]
\[
e^2 M \left( \sqrt{\left( 1 + \frac{X}{c^{n+1}M} \pm \frac{u}{c^nM} \right)^2 + \frac{v^2}{c^nM^2} - 1} \right) \sim \frac{X}{c} \pm \frac{u}{2M} + \frac{v^2}{2M}. \]  \hspace{1cm} (2.15)

This relation suggests to approximate the operators \( \overline{Q}_{n,M} \) and \( Q_{n,M} \) by \( \overline{T}_M \) and \( T_M \) defined by the formulas
\[
\overline{T}_M f(x) = \int \exp(-v^2) f\left( \frac{X}{c} + u + \frac{v^2}{2M} \right) f\left( \frac{X}{c} - u + \frac{v^2}{2M} \right) du dv \]  \hspace{1cm} (2.16)
and
\[
T_M f(x) = \frac{2}{c\sqrt{\pi}} \overline{T}_M f\left( x - \frac{c}{4M} \right). \]  \hspace{1cm} (2.17)

As we shall see later, \( T_M \) maps a density function with zero expectation to such a function again, hence \( T_M \) is the natural approximation of the operator \( Q_{n,M} \). By relation (2.14) we can write
\[
f_{n+1}(x) = T_{M_n}f_n(x) + \varepsilon_n(x) \]  \hspace{1cm} (2.18)
with \( \varepsilon_n(x) = Q_{n,M_n}f_n(x) - T_{M_n}f_n(x) \), and because of (2.15) we expect that \( \varepsilon_n(x) \) is a small error term. We also expect that the limit \( M = \lim_{n \to \infty} M_n > 0 \) exists.

Given a number \( M > 0 \) we look for the solution of the fixed point equation \( f = T_M f \) and investigate the speed of convergence of the sequence \( T_M f, n = 1, 2, \ldots \) to this fixed point for a general function \( f \) as \( n \to \infty \). If this convergence turns out to be sufficiently fast then it is natural to expect that our sequence \( f_n \) tends to the fixed point as \( n \to \infty \).

For our purposes it will be sufficient to investigate the operators \( \overline{T}_M \) and \( T_M \) in the spaces \( \mathcal{A} \) and \( \mathcal{A}_0 \subset \mathcal{A} \)
\[
\mathcal{A} = \left\{ f, \int e^{sx} |f(x)| dx < \infty \text{ if } |s| < s(f) \text{ with some } s(f) > 0 \right\} \]  \hspace{1cm} (2.19)
We can work better with the Fourier transforms $\tilde{T}_M f$ and $\tilde{T}_M \tilde{f}$. (We define the operator $\tilde{T}_M$ and $\tilde{T}_M$ by the identities $\tilde{T}_M f = (\tilde{T}_M f)^\sim$ and $\tilde{T}_M \tilde{f} = (\tilde{T}_M f)^\sim$.)

We get, by applying the change of variables $z = \frac{x}{c} + u + \frac{v^2}{2M}$ and $y = \frac{x}{c} - u + \frac{v^2}{2M}$ instead of $x$ and $u$, that

$$\tilde{T}_M \tilde{f}(\xi) = \int \exp(i\xi x - v^2)f\left(\frac{x}{c} - u + \frac{v^2}{2M}\right)f\left(\frac{x}{c} + u + \frac{v^2}{2M}\right)dxdu =$$

$$= \frac{c}{2} \int f(y)f(z) \exp\left(i\xi \frac{c}{2} \left( z + y - \frac{v^2}{M} \right) - v^2 \right)dydz =$$

$$= \frac{c}{2} \int f(y)\left(\frac{c}{2} \xi \right)^2 \int \exp\left(-v^2 \left(1 + \frac{i\xi}{2M} \right) \right)dv =$$

$$= \frac{c}{2} \sqrt{\frac{\pi}{1 + i\frac{c\xi}{2M}}} \tilde{f}\left(\frac{c}{2} \xi \right)^2 \quad \text{for} \quad f \in \mathcal{A}. \quad (2.20)$$

and

$$\tilde{T}_M \tilde{f}(\xi) = \frac{\exp\left(i\frac{c}{4M} \xi \right)}{\sqrt{1 + i\frac{c\xi}{2M}}} \tilde{f}\left(\frac{c}{2} \xi \right)^2, \quad f \in \mathcal{A}. \quad (2.20)'$$

Since $\tilde{f}(0) = \int f(x)dx$ and $\tilde{f}'(0) = i \int xf(x)dx$ relation (2.20)' implies that

$$\int T_M f(x)dx = \left[\int f(x)dx\right]^2 \quad (2.21)$$

and

$$\int xT_M f(x)dx = c \int f(x)dx \cdot \int xf(x)dx. \quad (2.21)'$$

As a consequence, $\int T_M f(x)dx = 1$ and $\int xT_M f(x)dx = 0$ if $f \in \mathcal{A}_0$, and this relations explain our scaling in the definition of the operator $T_M$. 

Annales de l'Institut Henri Poincaré - Physique théorique
By (2.20) the fixed point equation \( f = T_M f \) can be rewritten in the space of Fourier transforms as

\[
\hat{f}(\xi) = \frac{\exp \left( \frac{i c}{4M} \xi \right)}{\sqrt{1 + i \frac{c \xi}{2M}}} \hat{f}^2 \left( \frac{c}{2} \xi \right)
\]

or, by taking logarithm,

\[
\log \hat{f}(\xi) = 2 \log \hat{f} \left( \frac{c}{2} \xi \right) + i \frac{c}{4M} \xi - \frac{1}{2} \log \left( 1 + i \frac{c}{2M} \xi \right).
\]

(2.22)

We are looking for the solution of the equation (2.22) in the space \( f \in \mathcal{A}_0 \) in the form \( \log \hat{f}(\xi) = \sum_{k=2}^{\infty} a_k \xi^k \). (Observe that for \( f \in \mathcal{A}_0 \)

\[
\log \hat{f}(0) = \frac{d}{dx} \log \hat{f}(0) = 0,
\]

therefore \( a_0 = a_1 = 0 \) in the above expansion.) Then by (2.22)

\[
\sum_{k=2}^{\infty} \left( 1 - 2 \left( \frac{c}{2} \right)^k \right) a_k \xi^k = \frac{1}{2} \sum_{k=2}^{\infty} \frac{1}{k} \left( -i c \right)^k \xi^k
\]

and

\[
a_k = \frac{(- i c)^k}{2k \left[ 1 - \left( \frac{c}{2} \right)^k \right] !} \xi^k.
\]

In such a way we have defined \( \log \hat{f}(\xi) \) in a small neighbourhood of zero, and it is analytic there. Then by (2.22) it can be continued analytically to the whole real line, and this analytic continuation gives the solution of the fixed point equation.

If \( \log \hat{g}(\xi) \), \( g \in \mathcal{A}_0 \), is analytic in a small neighbourhood of zero then it can be written in the form \( \log \hat{g}(\xi) = \sum_{k=2}^{\infty} d_k \xi^k \) with some coefficients \( d_k \), and the same calculation as before supplies that \( \log \hat{T}_M \hat{g}(\xi) = \sum_{k=2}^{\infty} T_{M,k}(d_k) \xi^k \) with

\[
T_{M,k}(d) = 2 \left( \frac{c}{2} \right)^k d + \frac{1}{2k} \left( -i c \right)^k.
\]

Since \( 2 \left( \frac{c}{2} \right)^k < 1 \) for \( k \geq 2 \) if \( 1 < c < \sqrt{2} \) the coefficients of the Taylor...
series of the function \( \log T_{M}^{\nu}(\xi) T_{M}^{(n)}(d_k) \), \( k = 2, 3, \ldots \), tend to \( \alpha_k \) exponentially fast as \( n \to \infty \). This means that the convergence to the solution of the fixed point equation is sufficiently fast.

One has to overcome several technical difficulties when trying to turn the above heuristic argument into a rigorous proof. In the next section we explain which are the main difficulties during the proof of Theorem 1' and how we want to overcome them.

3. ON THE STRATEGY OF THE PROOF: THE INDUCTIVE PROCEDURE

The main difficulty in the proof of Theorem 1' consists in the justification of formula (2.18) together with a good bound on \( \varepsilon_n(x) \) in it. Let us remark that such a relation can be expected only for large \( n \). Indeed, when the operator \( Q_{n,M} \) is approximated by \( T_{M} \) then the kernel \( \exp \left( - \frac{u^2}{c^n} - v^2 \right) \) in the integral defining \( Q_{n,M}f \) is changed to \( \exp (- v^2) \), and this change causes a negligible error only if \( n \) is large. For small \( n \) we need a different method to control the behaviour of the function \( f_n(x) \).

Let us first consider the starting function \( q_0(x, T) \) defined in (2.3)'. Simple calculation shows that if \( T < a_0 \) then the function \( \bar{q}_0(x, T) \) has two maxima (in the variable \( x \)) in the points \( \pm \bar{M}_0 \)

\[
\bar{M}_0^2 = \frac{a_1(a_0 - T)}{T^2 t} \tag{3.1}
\]

and

\[
\bar{q}_0(x, T) = \bar{C}_0(T) \exp \left\{ - \frac{a_0 - T}{a_1} (x - \bar{M}_0)^2 \left( 1 + \frac{(x - \bar{M}_0)^2}{2 \bar{M}_0} \right) \right\} \tag{3.1'}
\]

We shall show that if \( \bar{M}_0 \) is sufficiently large then

\[
f_0(x) = f_0(x, T) = n \left( x, \sqrt{\frac{a_1}{2(a_0 - T)}} \right) + R_1
\]

if \( x > - M_0 \), \( M_0 = \bar{M}_0 + \bar{R}_1 \) with some negligible error terms \( R_1 \) and \( \bar{R}_1 \), where \( n(x, \sigma) \) denotes the normal density function \( \frac{1}{\sqrt{2\pi\sigma}} \exp \left( - \frac{x^2}{2\sigma^2} \right) \) with expectation zero and variance \( \sigma^2 \). Moreover, we shall see that for small \( n \) (depending on \( \bar{M}_0 \)) \( M_n \sim \bar{M}_0 \), and the operator \( \bar{Q}_{n,M} f_n \) can be well approximated by

\[
\bar{T}_n f_n(x) = \int \exp \left( - \frac{u^2}{c^n} - v^2 \right) f_n \left( \frac{x}{c} - u \right) f_n \left( \frac{x}{c} + u \right) du dv =
\]

\[
= \sqrt{\pi} \int \exp \left( - \frac{u^2}{c^n} \right) f_n \left( \frac{x}{c} - u \right) f_n \left( \frac{x}{c} + u \right) du,
\]
i.e. a small error is committed even if the argument of $f_n$ in the integral is approximated not by (2.15), but the term $\frac{v^2}{2M^2}$ is dropped in its right-hand side. (But this is not true for large $n$.) Observe that $\hat{T}_n$ turns an almost Gaussian density function with variance $\sigma^2$ to an almost Gaussian density function with variance $\frac{c^2}{2} \cdot \sigma^2$. By refining the above argument we shall be able to prove the following

**Proposition 1.** — For all integers $N \geq 1$ there is some $K = K(N) > 0$ such that if $\hat{M}_0 = \frac{a_1(a_0 - T)}{T^2 t} > K$, $0 < T < \frac{1}{10}$ then for $n \geq N$

$$\left| \frac{d^j}{dx^j} f_n(x) - n \left( x, \left( \frac{c}{\sqrt{2}} \right)^n \sigma_0 \right) \right| \leq \frac{B(n)}{\sqrt{M_n}} \exp \left( - 2 \left( \frac{2}{c} \right)^n |x| \right),$$

if $j = 0, 1, 2$, $|x| < \log M_n$ (3.2)

$$\left| \frac{d^j}{dx^j} f_n(x) \right| \leq B(n) \exp \left( - \left( \frac{2}{c} \right)^n 2x + \frac{x^2}{M_n c^n} \right),$$

if $x > - c^n M_n$, $j = 0, 1, 2$ (3.3)

and

$$|M_n - M_0| \leq \frac{B(n)}{\sqrt{M_0}},$$

(3.4)

where $\sigma_0^2 = \frac{a_1}{2(a_0 - T)}$, and $B(n)$ is some appropriate multiplying factor depending on $n$ but not on $\hat{M}_0$ and $c$.

Let us now turn to the investigation of $Q_{n,M} f_n$ in the case of large $n$. A calculation of the error in the approximation (2.15) suggests that

$$|\overline{Q}_{n,M} f_n(x) - \overline{T}_n f_n(x)| \leq \text{const} \cdot q^n \cdot \sup |f_n'(y)|^2$$

(3.5)

with some $0 < q < 1$. It is relatively simple to demonstrate formula (3.5), but it is useful only if we have an additional estimate on $\sup |f_n'(y)|$ which shows that the dominating term on the right hand side of (3.5) is $q^n$ and not $\sup |f_n'(y)|^2$. To prove this additional estimate we have to carry out a much more refined analysis where the function $f_n$ is bounded simultaneously with its Fourier transform.

More precisely, since $f_n(x - c^n M_n) = f_n(x + c^n M_n)$, the function $f_n$ has a peak not only at zero but also at $-2c^n M_n$. As a consequence, the Fourier transform of $f_n$ does not behave nicely, and it is useful to make a regularization of $f_n(x)$ and to work with its Fourier transform.
DEFINITION. — Let us choose some fixed function \( \phi \in C_0^\infty(\mathbb{R}) \) such that
\[
1 \geq \phi(x) \geq 0 \text{ for all } x \in \mathbb{R}, \quad \phi(x) = 1 \text{ for } |x| \leq 1 \quad \text{and} \quad \phi(x) = 0 \text{ for } |x| \geq 2.
\]
Put \( \phi_n(x) = \phi \left( \frac{1}{100} e^{-n/2} x \right) \). Given some function \( f \), \( f(x) \geq 0 \), \( \int |x| f(x) dx < \infty \), we define its \( n \)-th regularization \( \phi_n(f) \) as
\[
\phi_n(f)(x) = \frac{1}{A_n} \phi_n(x + B_n) f(x + B_n)
\]
with \( A_n = \int \phi_n(x) f(x) dx \) and \( B_n = \frac{1}{A_n} \int x \phi_n(x) f(x) dx \), provided that the above formula is meaningful, i.e. \( A_n > 0 \).

(Let us remark that although the Fourier transforms \( \phi_n(f)(\xi) \) and \( \phi_n(f_n)(\xi) \) are not similar, nevertheless the functions \( Q_{n,M} f_n(x) \) and \( Q_{n,M} \phi_n(f_n)(x) \) are for typical \( x \) (\( x \) not very far from the origin) close to each other since the main contribution to the integrals defining them are in a small neighbourhood of zero, where \( f_n \) and \( \phi_n(f_n) \) are close to each other. This is the reason why we can use our information about \( \phi_n(f_n)(\xi) \) in the investigation of \( f_n(x) \).) First we shall prove the following

COROLLARY OF PROPOSITION 1. — Under the conditions of Proposition 1 we have for \( n \leq N \)
\[
| \phi_n(f_n)(t + is) | \leq \frac{\exp (\beta_n s^2)}{1 + \alpha_n t^2} \quad |s| < 2 \cdot (\sqrt{2/c})^n, \quad t \in \mathbb{R}^1,
\]
and
\[
\left| \frac{d^j}{dx^j} f_n(x) \right| \leq \frac{10^5}{\beta_n^{(j+1)/2}} \exp \left( -\frac{1}{\sqrt{\beta_n}} \left| 2x + \frac{x^2}{c^n M_n} \right| \right) \quad \text{if } x > -c^n M_n
\]
with \( \alpha_n = \frac{1}{200} \left( \frac{c^2}{2} \right)^n \) and \( \beta_n = \left( \frac{c^n}{2} \right)^n \).

We shall formulate an inductive assumption about the functions \( f_n(x) \) and \( \phi_n(f_n(t + is)) \) for all \( n \). But first we have to understand their behaviour better. Formula (3.2) shows that \( \sup f_0(x) < C \) with some bound \( C \) independent of \( \overline{M}_0 \), and for small \( n \) \( \sup \ f_{n+1}(x) \sim f_{n+1}(0) \sim \frac{\sqrt{2}}{c} \sup f_n(x) \). On the other hand it is natural to expect that for large \( n \), \( f_n(x) \sim g_M(x) \), where \( g_M \) is the solution of the fixed point equation \( g_M = T_M g_M \). Since \( g_M(x) = M g_1 \left( \frac{x}{M} \right) \), hence \( \sup g_M(x) \sim M \). The above considerations suggest the following picture: for small \( n \) the value of \( \sup f_n(x) \) is growing exponentially fast, first at rate \( \sqrt{2/c} \) then slower and slower, and finally for large \( n \) it gets stabilized at \( \overline{M}_0 \). If \( \sup f_n(x) = K_n \) then \( f_n(x) \) is

Annales de l’Institut Henri Poincaré - Physique théorique
negligible small outside a region of size \( \frac{1}{K_n} \), i.e. as the function \( f_n(x) \) is growing it gets more localized. This behaviour of the function \( f_n \) is reflected in a slightly hidden way in the properties \( I(n) \) and \( J(n) \) defined below.

Let us fix some positive integer \( N \), and introduce the sequences \( \alpha_n \) and \( \beta_n \) (with starting index \( N \)) as

\[
\alpha_N = \frac{1}{200} \left( \frac{c^n}{2} \right)^N \quad (3.8)
\]

\[
\alpha_{n+1} = \frac{c^2}{2} \left( 1 - c^{-\frac{n}{2}} \right) \alpha_n + \frac{10^{-12}}{M_n^2} \quad \text{for} \quad n \geq N, \quad (3.8')
\]

and

\[
\beta_N = \left( \frac{c^n}{2} \right)^N \quad (3.9)
\]

\[
\beta_{n+1} = \frac{c^2}{2} \left( 1 + c^{-\frac{n}{2}} \right) \beta_n + \frac{10}{M_n^2} \quad \text{for} \quad n \geq N, \quad (3.9')
\]

where \( M_n \) is defined in formula (2.7).

Now we define

**Property I(n)**

Let \( n \geq N \). The function \( f_n \) satisfies Property I(n) (with starting index \( N \) and multiplying factor \( C \)) if

\[
\left| \frac{d^j}{dx^j} f_n(x) \right| \leq \frac{C}{\beta_n^{(j+1)/2}} \exp \left( -\frac{1}{\sqrt{\beta_n}} \left| 2x + \frac{x^2}{c^n M_n} \right| \right)
\]

for \( j = 0, 1, 2, \quad x > -c^n M_n \) (3.10)

with the above defined \( \beta_n \) and the number \( M_n \) defined in (2.7).

and

**Property J(n)**

Let \( n \geq N \). The function \( f_n(x) \) satisfies Property J(n) (with starting index \( N \)) if

\[
| \tilde{\phi}_n(f_n)(t + is) | \leq \frac{\exp \beta_n s^2}{1 + \alpha_n t^2} \quad \text{for} \quad |s| < \frac{2}{\sqrt{\beta_n}}. \quad (3.11)
\]

The content of Properties I(n) and J(n) is very similar. As we shall see later, \( C_1 < \frac{\beta_n}{\alpha_n} < C_2 \) with some appropriate \( C_1 > 0 \) and \( C_2 > 0 \) for all \( n \).

It is natural that the bound on the right-hand of (3.11) depends on \( s^2 \) and \( t^2 \), since in the Taylor expansion of \( \tilde{\phi}_n(f_n)(x) \) the first term disappears because

of the relation \( \frac{d}{dx} \phi_n(x) \bigg|_{x=0} = \int x \phi_n(x) \, dx = 0 \). Formula (3.11) in a small neighbourhood of zero tells us that the variance of a random variable with density function \( \phi_n(x) \) is between \( 2\sigma_n \) and \( 2\beta_n \), hence \( \phi_n(x) \) is essentially concentrated in a domain of size const. \( \frac{1}{\sqrt{\beta_n}} \). The bound on \( \tilde{\phi}_n(f_n)(t + is) \) in the complex domain tells, roughly speaking, that \( \phi_n(x) \) tends to zero with the rate \( \exp \left( -\frac{2|x|}{\sqrt{\beta_n}} \right) \) as \( |x| \to \infty \).

Finally we remark that the smoothness of the function \( \phi_n(f_n) \) is connected with the decrease of its Fourier transform at infinity. Property \( J(n) \) states a decrease of order \( O(t^{-2}) \). This is a weaker property than the second order differentiability of the function \( f_n \) imposed in Property \( I(n) \), but it is enough for our purposes.

In the exponent at the right-hand side of (3.10) the term \( 2x \) is essential, and the term \( \frac{x^2}{c^a M_n} \) could be omitted. In that case the proof could be carried out with some small changes, only it would become considerably longer. The same remark applies for the formulas in Propositions 2 and 3.

The main step of the proof of Theorem 1' is the following

**Proposition 3.** — *The multiplying factor \( C \) in Property \( I(n) \) can be chosen in such a way (e.g. any \( C \geq e^{1000} \) is an appropriate choice) that if \( N > N_0(c, C) \) with some appropriate threshold \( N_0 \) depending only on \( c \) and \( C \), \( n \geq N \), \( |M_n - M_{n-1}| < 1 \), \( M_n > K(c) \) with some \( K(c) > 0 \) independent of \( n \), \( f_n(x) \) satisfies Properties \( I(n) \) and \( J(n) \) (with the above defined multiplying factor \( C \) and starting index \( N \)) \( 100 > \beta_n > \max \left( \frac{9}{M_n^{2a}}, \frac{4^{-n}}{M_n} \right) \), then \( f_{n+1}(x) \) satisfies Properties \( I(n+1) \) and \( J(n+1) \) (with the same parameters \( C \) and \( N \)), and

\[
M_{n+1} = M_n - \frac{1}{4c^a M_n} + \frac{\gamma(n)}{c^n}, \quad |\gamma(n)| < C_1 c^{-n} \sqrt{\beta_n} \quad (3.12)
\]

with some absolute constant \( C_1 \). Moreover,

\[
\left| \frac{d}{dx} \left[ f_{n+1}(x) - T_{M_n} \phi_n(f_n)(x) \right] \right| \leq \frac{C_1 C^4}{\beta_n^{(i+1)/2}} c^{-n} \left[ \exp \left( -\frac{1}{\sqrt{\beta_{n+1}}} \left| 2x + \frac{x^2}{c^{n+1} M_{n+1}} \right| \right) + \exp \left( -\frac{2|x|}{\sqrt{\beta_{n+1}}} \right) \right] \quad (3.13)
\]
for \( x > - c^{n+1}M_{n+1}, j = 0, 1, 2, \) and

\[
\left| \frac{d^j}{dx^j} T_M \phi_n(f_n)(x) \right| \leq \frac{C_1 C^2}{\beta_n^{(j+1)/2}} \exp \left( - \frac{2 |x|}{\beta_n^{1/2}} \right), \quad x \in \mathbb{R}, \quad j = 0, 1, 2, 3, 4
\]

(3.14)

with some absolute constant \( C_1. \)

As a consequence, if \( M_0^2 = \frac{a_1(a_0 - T)}{T^2 u} \) is sufficiently large and \( 0 < T < \frac{1}{10} \) then Properties I(n) and J(n) hold for all \( f_n(x), n \geq N, \) if the parameters \( C \) and \( N \) are appropriately chosen, and in this case relations (3.12), (3.13) and (3.14) also hold.

We shall prove Proposition 3 with the help of the following Proposition 2 which can be considered as a more refined and elaborated version of formula (3.5). We recall that the operators \( Q_{n,M} \) and \( Q_{n,M}^* \) were defined in Section 2 for \( f \in \mathcal{A}_{n,M}. \)

**Proposition 2.** Given some positive integer \( n \) and real numbers \( M > 100, \) \( \varepsilon > 0 \) let us consider some \( f \in \mathcal{A}_{n,M} \) such that

\[
\int_{-c^n M}^\infty f(x)dx = 1, \quad \int_{-c^n M}^\infty x f(x)dx = 0, \quad \text{and} \quad \int_{-c^n M}^\infty \left| f(x) \right| dx \leq C_n M,
\]

with some \( \beta \) and \( C \) such that \( 100 > \beta > \max \left( \frac{4}{(1 - \varepsilon)M^2}, 4^{-n} \right), \) and let \( n > n_0(c, C) \), where the threshold \( n_0(c, C) \) depends only on \( c \) and \( C. \) Let \( \frac{1}{2} > \varepsilon > 10c^{-\frac{5}{4}}. \) Then there exists some \( C(\varepsilon) > 0 \) depending only on \( \varepsilon \) such that

\[
\left| \frac{d^j}{dx^j} Q_{n,M} f(x) \right| \leq C(\varepsilon) C^2 \beta^{-\frac{j+1}{2}} \exp \left( - \frac{2(1 - \varepsilon)}{c \sqrt{\beta}} \left| 2x + \frac{x^2}{c^n M} \right| \right)
\]

(3.16)

for \( x > - c^{n+1}M, j = 0, 1, 2, \)

\[
\left| \frac{d^j}{dx^j} T_M \phi_n(f_n)(x) \right| \leq C(\varepsilon) C^2 \beta^{-\frac{j+1}{2}} \exp \left( - \frac{4(1 - \varepsilon)}{c \sqrt{\beta}} |x| \right)
\]

(3.17)

for \( j = 0, 1, 2, 3, 4, x \in \mathbb{R}, \) and

\[
\left| \frac{d^j}{dx^j} [Q_{n,M} f(x) - T_M \phi_n(f_n)(x)] \right| \leq \frac{C(\varepsilon) C^4}{\beta_n^{j+1/2}} c^{-n} \left[ \exp \left( - \frac{2(1 - \varepsilon)}{c \sqrt{\beta}} \left| 2x + \frac{x^2}{c^n M} \right| \right) + \exp \left( - \frac{4(1 - \varepsilon)}{c \sqrt{\beta}} |x| \right) \right]
\]

(3.18)

Vol. 49, n° 1-1988,
for \( x > -\epsilon^{n+1}M \), \( j = 0, 1, 2 \), where
\[
\bar{M} = M + \frac{m_n}{c^n}
\]
and \( m_n \) is defined by formula (2.11). We also have
\[
m_n = -\frac{c}{4\bar{M}} + \gamma_n, \quad |\gamma_n| < C_1C^2c^{-n}\sqrt{\beta}
\]
with some absolute constant \( C_1 > 0 \).

In formulas (2.10)-(2.13) we have defined \( Q_n(f(x), M) = (Q_{\beta, M}f(x), \bar{M}) \),
and in Proposition 2 we have estimated \( Q_n(f(x), M) \) with the help of \( f(x) \) and \( M \). We would try to deduce Proposition 3 from Proposition 2 with
the choice \( f = f_n, \beta = \beta_n \) and \( M = M_n \). (The number \( \epsilon > 0 \) appears in
Proposition 2 for some technical reasons. At a later step of the proof we
need an almost optimal multiplying factor inside the exponent of formulas
(3.16)-(3.18).) The main difficulty which does not allow to deduce Propo-
sition 3 directly from Proposition 2 is that the multiplying factor in (3.16)
is \( C(\epsilon)C^2 \) which is too large to deduce Property I(\( n+1 \)) with the same
multiplying factor \( C \) which appears in Property I(\( n \)). We can overcome
this difficulty by investigating the functions \( f \) simultaneously with their
Fourier transform. This is the reason why we have formulated both Pro-
PERTIES I(\( n \)) and J(\( n \)). Our induction procedure works only for large \( n \),
Hence we have proved the Corollary of Proposition 1 which allows us to
start the induction from a large starting index. Then the following obser-
vations help us to carry out our induction procedure.

We have a better multiplying constant in the exponent of formula (3.16)
than we need in Property I(\( n+1 \)). Hence we can prove the inequality
appearing in Property I(\( n+1 \)) for large \( x \) by slightly decreasing the multi-
plying factor in the exponent of (3.16). On the other hand formula (3.18)
(observe that there is a factor \( c^{-n} \) on the right hand side) guarantees that
a negligible error arises if \( f_{n+1} = Q_{\beta, M}f_n \) is changed to \( T_M\phi_n(f_n) \). Then,
since the operator \( T_M \) can be naturally investigated in the space of the
Fourier transforms, we can complete the proof of Property I(\( n+1 \)) under
the conditions of Proposition 3 with the help of Property J(\( n \)). The impor-
tant point is that the bound we can give on \( T_M\phi_n(f_n) \) with the help of
Property J(\( n \)) does not depend on the constant \( C \) appearing in Property I(\( n \)).

The proof of Property J(\( n+1 \)) is similar. With the help of Proposition 2
the problem can be reduced to the bounding of \( T_M\phi_n(t + is) \) which can
be done with the help of Property J(\( n \)). The remaining statements of Pro-
position 3 can be deduced from Proposition 2 with some work.

Let us remark that we have bounded \( f_n(x) \) together with its first two
derivatives although only the bound given for \( f_n(x) \) is interesting for us.
But, since a Taylor expansion is applied in the inductive proof we need
some information about \( f_n'(x) \) in order to bound \( f_{n+1}(x) \). On the other
hand, the operators $Q_n$ and $T$, similarly to the convolution operator, have some smoothing properties, and it helps us to carry out the inductive procedure without weakening the smoothness conditions during the subsequent steps of induction. In particular, let us remark that in formulas (3.14) and (3.17) four derivatives of $T_M \tilde{\phi}_n(f)$ could be bounded with the help of only two derivatives of the function $f$.

Formula (3.13) in Proposition 3 can be considered as a more exact version of formula (2.18). It enables us to carry out the heuristic argument at the end of Section 2 in a precise form. In such a way we can prove that $\tilde{\phi}_n(f_n)(t)$ tends to $\tilde{g}_M(t)$ exponentially fast if $t \in D$, where $D$ is a small but fixed neighbourhood of zero, and $g_M$ is the solution of the fixed point equation $g_M = T_M g_M$. However, this knowledge is not sufficient to prove Theorem 1’. But by exploiting that $\tilde{\phi}_n(f_n+1)(t)$ can be well approximated by $T_M \tilde{\phi}_n(f_n)(t)$ and that formula (2.20) gives us the estimate

$$|\tilde{T}_M \tilde{\phi}_n(f_n)(t) - \tilde{g}_M(t)| = |\tilde{T}_M \tilde{\phi}_n(f_n)(t) - \tilde{T}_M \tilde{g}_M(t)| = \left(1 + \frac{c^2}{4M^2 t^2}\right)^{-1/2}.$$

we can give a good bound on $\sup_{t \in D_n} |\tilde{\phi}_n(f_n)(t) - \tilde{g}_M(t)|$ in an exponentially increasing domain $D_n$. Then by bounding $\tilde{\phi}_n(f_n)(t)$ and $\tilde{g}_M(t)$ for large $t$ and applying inverse Fourier transformation we are able to prove Theorem 1’.

Theorem 1 can be deduced from Theorem 1’ by expressing $p_n(x, T)$ with the help of $f_n(x)$ and $M_n$. The main difficulty of this deduction is connected with the following problem: it follows from Theorem 1’ that for large $n$, $q_n\left(\sqrt{\frac{a_1}{T}} x, T\right)$ is essentially concentrated in the domain

$$|x| - \sqrt{\frac{T}{a_1}} M < \text{const. } nc^{-n},$$

and we want to prove the same for $p_n(x, T)$ which can be expressed by $q_n(x, T)$ with the help of relation (2.5). To show this property we have to prove that for $|x| < \sqrt{\frac{T}{a_1}} M$ the decrease of $q_n\left(\sqrt{\frac{a_1}{T}} x, T\right)/q_n(M, T)$ (in the variable $x$) is faster than the increase of

$$\exp\left(-\frac{a_0}{2T} c^2 x^2 + \frac{a_0}{2T} c^2 \frac{T}{a_1} M^2\right).$$

We can prove this statement by determining which number $\mu, \mu > 0$ can be written in formula (2.9)’, i.e. we need a better understanding about the decrease of the function $f_n$ outside the typical region. The essential technical difficulty after this step is to give a good asymptotic value for the norming constant $B_n$ in formula (2.5).

The proof of Theorem 2 requires an even better understanding of the behaviour of the functions \( f_n(x, T) \) and the function \( g(x) \) defined by formula (1.6) for \( |x| \to \infty \). We shall discuss the content of Theorem 2 and the difficulties arising during its proof in Section 9.

4. THE PROOF OF PROPOSITION 1 AND ITS COROLLARY. THE FIRST STEP OF THE INDUCTIVE PROCEDURE

First we prove formulas (3.2), (3.3) and (3.4) for \( n = 0 \). The function \( \tilde{q}_0(x, T) \) can be written in the form given by formulas (3.1) and (3.1)', where the norming constant \( \overline{C}_0(T) \) is given by (2.4). We have

\[
\frac{1}{\overline{C}_0(T)} = \int_0^\infty \exp \left[ - \frac{a_0 - T}{a_1} (x - \tilde{M}_0)^2 \left( 1 + \frac{x - \tilde{M}_0}{2\tilde{M}_0} \right)^2 \right] dx =
\int_{|x - \tilde{M}_0| < \tilde{M}_0/2} + \int_{|x - \tilde{M}_0| > \tilde{M}_0/2} = \left. \right|_{x > 0}
\]

and

\[
I_1 = \int_{-\tilde{M}_0/2}^{\tilde{M}_0/2} \exp \left( - \frac{a_0 - T}{a_1} x^2 \right) \left( 1 - \frac{a_0 - T}{a_1} \left( \frac{x^3}{\tilde{M}_0} + \frac{x^4}{2\tilde{M}_0} + O\left( \frac{x^4}{\tilde{M}_0^2} \right) \right) \right) dx =
\sqrt{\frac{a_1}{a_0 - T}} + O\left( \frac{1}{\tilde{M}_0} \right)
\]

\[
I_2 = O\left( \frac{1}{\tilde{M}_0^2} \right).
\]

Hence

\[
\overline{C}_0(T) = \sqrt{\frac{a_0 - T}{a_1}} + O\left( \frac{1}{\tilde{M}_0} \right). \tag{4.1}
\]

Similarly,

\[
\tilde{M}_0 - \tilde{M}_0 = \overline{C}(T) \int_0^\infty (x - \tilde{M}_0) \exp \left[ - \frac{a_0 - T}{a_1} (x - \tilde{M}_0)^2 \left( 1 + \frac{x - \tilde{M}_0}{2\tilde{M}_0} \right)^2 \right] dx =
O\left( \frac{1}{\tilde{M}_0} \right). \tag{4.2}
\]

Put \( \sigma_0^2 = \frac{a_1}{2(a_0 - T)} \). By relations (4.1) and (4.2)

\[
\mathcal{H}(x, \sigma_0) - f_0(x) = \mathcal{H}(x, \sigma_0) \left[ 1 - \left( 1 + O\left( \frac{1}{\tilde{M}_0^2} \right) \right) \right]
\exp \left\{ - \frac{\left( x + O\left( \frac{1}{\tilde{M}_0} \right) \right)^2}{2\sigma_0^2} \left( 1 + \frac{x + O\left( \frac{1}{\tilde{M}_0} \right)}{2M_0} \right)^2 + \frac{x^2}{2\sigma_0^2} \right\}
\]

Annales de l'Institut Henri Poincaré - Physique théorique
hence

$$|n(x, \sigma_0) - f_0(x)| \leq n(x, \sigma_0) \frac{O(|x|^3 + 1)}{M_0} \leq \frac{\exp \left( -\frac{x^2}{2\sigma_0^2} - 2\sigma_0^3 \right)}{\sqrt{M_0}} \leq \frac{\exp (-2|x|)}{\sqrt{M_0}} \quad \text{for} \quad |x| < \log M_0,$$

and similarly

$$\left| \frac{d^j}{dx^j} (n(x, \sigma_0) - f_0(x)) \right| \leq \frac{\exp (-2|x|)}{\sqrt{M_0}} \quad \text{for} \quad |x| < \log M_0, \quad j = 0, 1, 2.$$

We claim that

$$f_0(x) \leq C \exp \left( -\left| 2x + \frac{x^2}{M_0} \right| + 16\sigma_0^2 \right) \quad \text{for} \quad x > -M_0.$$

Indeed, if $M_0$ is sufficiently large ($M_0 > \frac{80\sigma_0^2}{3}$ is e.g. enough) then for $x > M_0$

$$f_0(x) = C \exp \left( \frac{x + O(\frac{1}{M_0})^2}{2\sigma_0^2} \right) \leq C \exp \left( -\frac{x^2}{10\sigma_0^2} \right) = C \exp \left( -\frac{3x^2}{80\sigma_0^2} \right) \leq C \exp \left( -\frac{x^2}{16\sigma_0^2} \right) \leq C \exp \left( -\frac{3x^2}{80\sigma_0^2} \right) \exp (-2|x| + 16\sigma_0^2) \leq C \exp \left( -\left| 2x + \frac{x^2}{M_0} \right| + 16\sigma_0^2 \right).$$

Similarly

$$\left| \frac{d^j}{dx^j} f_0(x) \right| \leq C \exp \left( -\left| 2x + \frac{x^2}{M_0} \right| \right) \quad \text{if} \quad x > -M_0, \quad j = 0, 1, 2.$$

The above relations imply formulas (3.2)-(3.4) for $n = 0$. For $0 < n < N$ we prove them by induction with the help of the following two lemmas.

**Lemma 1.** — Given some integer $n$, $0 \leq n < N$, and $M > 0$ such that $M > 4 \cdot \left( \frac{2}{c} \right)^N$ let us consider some $f \in \mathcal{A}_{n,M}$ which satisfies the inequality

$$\left| \frac{d^j}{dx^j} f(x) \right| \leq B(n) \exp \left( -\left( \frac{2}{c} \right)^n \left| 2x + \frac{x^2}{c^n M} \right| \right) \quad \text{for} \quad j = 0, 1, x > -c^n M \quad (4.3)$$

with some $B(n) > 0$. Then
\[
\left| \frac{d^j}{dx^j} Q_{n,M} f(x) \right| \leq B(n+1) \exp \left( - \left( \frac{2}{c} \right)^{n+1} \left| 2x + \frac{x^2}{c^{n+1}M} \right| \right) \quad \text{for } j = 0, 1, 2 \tag{4.4}
\]
with some appropriate $B(n+1)$ which depends only on $n$ and $B(n)$.

**Lemma 2.** — Let $n, M$ and $f(x)$ satisfy the conditions of Lemma 1. Moreover, let $f(x)$ be such that \( \int_{-cM}^{cM} f(x) dx = 1, \int_{-cM}^{cM} x f(x) dx = 0 \) and
\[
\left| \frac{d^j}{dx^j} \left[ f(x) - \mu \left( x, \left( \frac{c}{\sqrt{2}} \right)^{n} \sigma_0 \right) \right] \right| \leq \frac{B(n)}{\sqrt{M}} \exp \left( - 2 \left( \frac{2}{c} \right)^{n} |x| \right) \tag{4.5}
\]
for $j = 0, 1, 2$ and $|x| < \log M$, and let $M > K(N)$ with some sufficiently large $K(N) > 0$. Then
\[
\left| \frac{d^j}{dx^j} \left[ Q_{n,M} f(x) - \lambda_{\mu} \left( x, \left( \frac{c}{\sqrt{2}} \right)^{n} \sigma_0 \right) \right] \right| \leq \frac{B(n+1)}{\sqrt{M}} \exp \left( - 2 \left( \frac{2}{c} \right)^{n+1} |x| \right) \tag{4.6}
\]
for $j = 0, 1, 2$ and $|x| < \left( 1 + \frac{c - 1}{4} \right) \log M$, where
\[
\lambda_{\mu} = \frac{c}{2\sigma_0} \left( \frac{\sqrt{2}}{c} \right)^{n} \left( \frac{1}{c^n} + \frac{2^n}{c^2 \sigma_0^2} \right)^{-1/2},
\]
and $B(n+1)$ depends only on $B(n)$ and $n$.

**Proof of Lemma 1.** — Let us introduce the notation
\[
l_{n,M}^{\pm}(x, u, v) = c^n \left( \sqrt{\left( M + \frac{x}{c^{n+1}} \pm \frac{u}{c^n} \right)^2 + \frac{v^2}{c^n} - M} \right). \tag{4.7}
\]
A simple calculation shows that
\[
2l_{n,M}^{\pm}(x, u, v) + \frac{l_{n,M}^{\pm}(x, u, v)^2}{Mc^n} = \frac{v^2}{M} + 2 \left( \frac{x}{c} \pm u \right) + \frac{1}{c^n M} \left( \frac{x}{c^n} \pm u \right)^2. \tag{4.8}
\]
We claim that
\[
\left| 2l_{n,M}^{\pm}(x, u, v) + \frac{l_{n,M}^{\pm}(x, u, v)^2}{Mc^n} \right| \geq \left| 2l_{n,M}^{-}(x, u, v) + \frac{l_{n,M}^{-}(x, u, v)^2}{Mc^n} \right| \geq \frac{2}{c} \left| 2x + \frac{x^2}{c^{n+1}M} \right| - \frac{2}{M} \left( \frac{v^2}{c^n} + \frac{u^2}{c^n} \right). \tag{4.8'}
\]
Indeed, we get from (4.8) with the help of the inequalities $|A| + |B| \geq A + B$.
and \(|A| + |B| \geq -A - B\) that the left-hand side of (4.8)' can be estimated from below both by
\[
\frac{2}{c} \left(2x + \frac{x^2}{c^sM} \right) + \frac{2}{M} \left(v^2 + \frac{u^2}{c^s} \right) \quad \text{and} \quad -\frac{2}{c} \left(2x + \frac{x^2}{c^sM} \right) - \frac{2}{M} \left(v^2 + \frac{u^2}{c^s} \right).
\]
These estimates imply (4.8)'.

Relations (4.8)', (4.3) and the inequality \(M > 4 \cdot \left(\frac{2}{c}\right)^N > 4 \cdot \left(\frac{2}{c}\right)^n\) imply that
\[
\exp \left(-\frac{u^2}{c^n} - v^2 \right) f(l_{n,M}(x, u, v))f(l_{n,M}(x, u, v)) \leq
\]
\[
\leq B(n)^2 \exp \left\{ -\left(\frac{2}{c}\right)^{n+1} \left|2x + \frac{x^2}{c^{n+1}M} \right| - \left(\frac{u^2}{c^n} + v^2\right) \left(1 - \frac{2}{M} \left(\frac{2}{c}\right)^n\right) \right\} \leq
\]
\[
\leq B(n)^2 \exp \left(\frac{2}{c} \left|2x + \frac{x^2}{c^{n+1}M} \right| \cdot \exp \left(-\frac{1}{2} \left(\frac{u^2}{c^n} + v^2\right) \right) \right). 
\quad (4.9)
\]
We get formula (4.4) for \(j = 0\) by integrating inequality (4.9) with respect to the variables \(u\) and \(v\). The case \(j = 1, 2\) can be investigated similarly.

The quantities \(\frac{d}{dx} Q_{n,M}(x)\) and \(\frac{d^2}{dx^2} Q_{n,M}(x)\) can be expressed as
\[
\frac{d}{dx} Q_{n,M}(x) =
\]
\[
= \frac{2}{c} \int \exp \left(-\frac{u^2}{c^n} - v^2 \right) \left( M + \frac{x}{c^{n+1}} + \frac{u}{c^n} \right) \left( M + \frac{x}{c^{n+1}} + \frac{u}{c^n} \right)^{\frac{2}{c^n}} - \frac{1}{2} \cdot
\]
\[
\cdot f'(l_{n,M}^+(x, u, v)) f(l_{n,M}^-(x, u, v)) \, du \, dv \quad (4.10)
\]
and
\[
\frac{d^2}{dx^2} Q_{n,M}(x) = \frac{4}{c^n} \int \exp \left(-\frac{u^2}{c^n} - v^2 \right) \left( M + \frac{x}{c^{n+1}} + \frac{u}{c^n} \right) \left( M + \frac{x}{c^{n+1}} - \frac{u}{c^n} \right)
\]
\[
\cdot \left[ \left( M + \frac{x}{c^{n+1}} + \frac{u}{c^n} \right)^2 + \frac{v^2}{c^n} \right]^{-\frac{1}{2}} \left[ \left( M + \frac{x}{c^{n+1}} - \frac{u}{c^n} \right)^2 + \frac{v^2}{c^n} \right]^{-\frac{1}{2}} \cdot
\]
\[
\cdot f'(l_{n,M}^+(x, u, v)) f'(l_{n,M}^-(x, u, v)) \, du \, dv -
\]
\[
- \frac{4}{c^{n+2}} \int u \exp \left(-\frac{u^2}{c^n} - v^2 \right) \left( M + \frac{x}{c^{n+1}} + \frac{u}{c^n} \right) \left( M + \frac{x}{c^{n+1}} + \frac{u}{c^n} \right)^{\frac{2}{c^n}} - \frac{1}{2} \cdot
\]
\[
f'(l_{n,M}^+(x, u, v)) f(l_{n,M}^-(x, u, v)) \, du \, dv \quad (4.10)'
\]
Relations (4.10) and (4.10)' can be obtained by differentiating formula (2.10) after the change of variable \(u' = M + \frac{x}{c^{n+1}} - \frac{u}{c^n}\) and then (when calculating the second derivative) \(u'' = M + \frac{x}{c^{n+1}} + \frac{u}{c^n}\). Observe that the second
derivative of $Q_{n,M}f$ is expressed in (4.10)' with the help of the first derivative of $f$. This means in particular that for the existence of the second derivative of $Q_{n,M}f$ it is enough that $f$ is once differentiable. Since
\[
\left| \left(M + \frac{x}{c^{n+1}} \pm \frac{u}{c^n} \right)^2 \left(M + \frac{x}{c^{n+1}} \pm \frac{u}{c^n} \right)^{1/2} \right| \leq 1
\]
relations (4.10) and (4.10)' imply that
\[
\left| \frac{d}{dx} Q_{n,M}f(x) \right| \leq \frac{2}{c} \int \exp\left(-\frac{u^2}{c^n} - v^2\right) \left| f'(l_{n,M}^+(x, u, v)) \right| \left| f'(l_{n,M}^-(x, u, v)) \right| dudv \tag{4.11}
\]
and
\[
\left| \frac{d^2}{dx^2} Q_{n,M}f(x) \right| \leq \frac{4}{c^2} \int \exp\left(-\frac{u^2}{c^n} - v^2\right) \left| f'(l_{n,M}^+(x, u, v)) \right| \left| f'(l_{n,M}^-(x, u, v)) \right| dudv + \frac{4}{c^{n+2}} \int |u| \exp\left(-\frac{u^2}{c^n} - v^2\right) \left| f'(l_{n,M}^+(x, u, v)) \right| \left| f'(l_{n,M}^-(x, u, v)) \right| dudv \tag{4.11}'
\]
Formula (4.4) for $j = 1, 2$ follows from (4.3), (4.8), (4.11) and (4.11)' in the same way as it was proved for $j = 0$.

**Proof of Lemma 2.** — First we consider the case $j = 0$. We show that
\[
\left| l_{n,M}^+(x, u, v) - \left(\frac{x}{c} \pm u + \frac{v^2}{2M}\right) \right| \leq 5 \left(\frac{v^4}{c^n M^3} + \frac{x^2 + u^2}{c^n M}\right) \tag{4.12}
\]
if $|x| < \frac{1}{4} c^{n+1} M$, $|u| < \frac{1}{4} c^n M$, $v^2 < c^n M$. Indeed,
\[
\left| l_{n,M}^+(x, u, v) - \left(\frac{x}{c} \pm u + \frac{v^2}{2M}\right) \right| =
\]
\[
= \left| c^n \left(M + \frac{x}{c^{n+1}} \pm \frac{u}{c^n} \right) \left(\sqrt{1 + \frac{v^2}{c^n \left(M + \frac{x}{c^{n+1}} \pm \frac{u}{c^n}\right)^2}} - 1\right) - \frac{v^2}{2M} \right| \leq \frac{v^2}{2M} \left| \frac{1}{1 + \frac{x}{c^{n+1} M} \pm \frac{u}{c^n M}} - 1 \right| + \frac{v^4}{c^n \left(M + \frac{x}{c^{n+1}} \pm \frac{u}{c^n}\right)^3} \leq \frac{v^2}{M} \left| \frac{x}{c^{n+1} M} \pm \frac{u}{c^n M} \right| + \frac{4v^2}{c^n M^3} \leq 5 \left(\frac{v^4}{c^n M^3} + \frac{x^2 + u^2}{c^n M}\right).
\]

*Annales de l'Institut Henri Poincaré - Physique théorique*
Define the set $A = A(M) = \left\{ (u, v), |u| < \frac{c - 1}{2c} \log M, |v| < M^{1/4} \right\}$. First we prove that

$$\left| \int_A \exp \left( - \frac{u^2}{c^n} - v^2 \right) f(l_{n,M}^+(x, u, v)) f(l_{n,M}^-(x, u, v)) du dv - \lambda_n \mu \left( \frac{c}{\sqrt{2}} \sigma_0 \right) \right| \leq \frac{\overline{B}(n)}{\sqrt{M}} \exp \left( -2 \left( \frac{2}{c} \right)^n |x| \right).$$ (4.13)

For this aim we show that for $r_n^\pm(x, u, v) = f(l_{n,M}^\pm(x, u, v)) - \mu \left( \frac{x}{c} \pm u, \left( \frac{c}{\sqrt{2}} \right)^n \sigma_0 \right)$

$$|r_n^\pm(x, u, v)| \leq \frac{\overline{B}(n)}{\sqrt{M}} \exp \left( -2 \left( \frac{2}{c} \right)^n \left| \frac{x}{c} \pm u \right| \right) \quad \text{if} \quad (u, v) \in A,$$

$$|x| < \left( 1 + \frac{c - 1}{4} \right) \log M. \quad (4.14)$$

Indeed, it follows from (4.12) that for $|x| < \left( 1 + \frac{c - 1}{4} \right) \log M, (u, v) \in A,$

$$\left| l_{n,M}^\pm(x, u, v) - \left( \frac{x}{c} \pm u \right) \right| \leq \frac{1}{\sqrt{M}}.$$ Hence

$$\left| \frac{x}{c} \pm u \right| < \left( \frac{c + 3}{4c} + \frac{c - 1}{2c} \right) \log M < \log M, \ |l_{n,M}^\pm(x, u, v)| < \log M,$$

and by (4.5)

$$\left| f(l_{n,M}^\pm(x, u, v)) - \mu \left( \frac{x}{c} \pm u, \left( \frac{c}{\sqrt{2}} \right)^n \sigma_0 \right) \right| \leq \frac{3B(n)}{\sqrt{M}} \exp \left( -2 \left( \frac{2}{c} \right)^n \left| \frac{x}{c} \pm u \right| \right) +$$

$$+ \left| \mu \left( l_{n,M}^\pm(x, u, v), \left( \frac{c}{\sqrt{2}} \right)^n \sigma_0 \right) - \mu \left( \frac{x}{c} \pm u, \left( \frac{c}{\sqrt{2}} \right)^n \sigma_0 \right) \right| \leq$$

$$\leq \frac{3B'}{\sqrt{M}} \exp \left( -2 \left( \frac{2}{c} \right)^n \left| \frac{x}{c} \pm u \right| \right) + \frac{C}{\sqrt{M}} \exp \left( -\frac{1}{4} \left( \frac{2}{c^2} \right)^n \frac{1}{\sigma_0^2} \left( \frac{x}{c} \pm u \right)^2 \right).$$

Because of the inequality $\frac{1}{4} \left( \frac{2}{c^2} \right)^n \frac{1}{\sigma_0^2} \left( \frac{x}{c} \pm u \right)^2 + 2 \left( \frac{2}{c} \right)^n \left| \frac{x}{c} \pm u \right| - 4 \cdot 2^n \sigma_0^2 \leq 0$

$$\exp \left( -\frac{1}{4} \left( \frac{2}{c^2} \right)^n \frac{1}{\sigma_0^2} \left( \frac{x}{c} \pm u \right)^2 \right) \leq \exp \left( -2 \left( \frac{2}{c} \right)^n \left| \frac{x}{c} \pm u \right| + 4 \cdot 2^n \sigma_0^2 \right),$$

and the above relations imply (4.14).

We have for $|x| < \left(1 + \frac{c - 1}{4}\right) \log M$

$$\int_{A} \exp \left(-\frac{u^2}{c^2} - v^2\right) \left(\frac{x}{c} + u, \left(\frac{c}{\sqrt{2}}\right)\sigma_0\right) \left(\frac{x}{c} - u, \left(\frac{c}{\sqrt{2}}\right)\sigma_0\right) du dv =$$

$$= \int \frac{2^n}{2\pi c^n \sigma_0^2} \exp \left(-\frac{u^2}{c^2} - v^2 - \frac{2^n}{c^2 \sigma_0^2} \left(\frac{x^2}{c^2} + u^2\right)\right) du dv + R_n(x) =$$

$$= \lambda_n \left(x, \left(\frac{c}{\sqrt{2}}\right)^{n+1} \sigma_0\right) + R_n(x), \quad (4.15)$$

with

$$|R_n(x)| = \left| \int_{R^2 - A} \right| \leq C \exp \left(-\frac{1}{\sigma_0^2} \left(\frac{c - 1}{2c}\right) \log M \right)^2 \leq$$

$$\leq \frac{B}{\sqrt{M}} \exp \left(-2 \left(\frac{2}{c}\right)^{n+1} \frac{|x|}{c}\right), \quad (4.15)'$$

(Here we applied that for large $M$ and $\epsilon = \frac{1}{2\sigma_0^2} \left(\frac{c - 1}{2c}\right)^2 \epsilon \log^2 M > \left(\frac{2}{c}\right)^{n+1} |x|$ and $\exp \left(-\epsilon (\log^2 M) < \frac{1}{\sqrt{M}}\right)$.) Hence to prove (4.13) it is enough to have a good bound on

$$I_1 = \int_{A} r_n^+(x, u, v) \left(\frac{x}{c} + u, \left(\frac{c}{\sqrt{2}}\right)\sigma_0\right) du dv$$

and

$$I_2 = \int_{A} r_n^-(x, u, v) r_n^-(x, u, v) du dv .$$

We get from (4.14), integrating first by the variable $v$ that

$$I_1 \leq \frac{B(n)'}{\sqrt{M}} \int \exp \left[-2 \left(\frac{2}{c}\right)^n \frac{x}{c} + u\right] \left(-\frac{1}{2} \left(\frac{2}{c}\right)^n \left(\frac{x}{c} - u\right)^2\right) du =$$

$$= \frac{B(n)'}{\sqrt{M}} \int \exp \left[-\frac{1}{2\sigma_0^2} \left(\frac{2}{c}\right)^n u^2 - 2 \left(\frac{2}{c}\right)^n \frac{2x}{c} - u\right] du .$$

Because of the evenness of the left hand side (4.13) in the variable $x$ we may assume that $x \geq 0$. We get that

$$I_1 \leq \frac{B(n)'}{\sqrt{M}} \left\{ \int_{-\infty}^{2x/c} \exp \left[-\frac{1}{2} \left(\frac{2}{c}\right)^n u^2 + 2 \left(\frac{2}{c}\right)^n u\right] du \exp \left(-2 \cdot \left(\frac{2}{c}\right)^{n+1}\frac{x}{c}\right) +$$

$$+ \int_{2x/c}^{\infty} \exp \left[-\frac{1}{2} \left(\frac{2}{c}\right)^n u^2 - 2 \left(\frac{2}{c}\right)^n u + 2 \cdot \left(\frac{2}{c}\right)^{n+1}\frac{x}{c}\right] du \right\} \leq$$

$$\leq \frac{B(n)''}{\sqrt{M}} \left[ \exp \left(-2 \left(\frac{2}{c}\right)^{n+1}\frac{x}{c}\right) + \exp \left(-\frac{1}{2} \left(\frac{2}{c}\right)^n \frac{4x^2}{c^2 \sigma_0^2}\right) \right] .$$

Annales de l'Institut Henri Poincaré - Physique théorique
(The last integral can be bounded by constant times the value of the integrand in $2x/c$.)

Since

$$\frac{1}{2}\left(2\frac{x^2}{c^2}\frac{4x^2}{c^2}\sigma_0^2\right) \leq 2\left(2\frac{x}{c}\right)^n + 2n\sigma_0^2$$

$$I_1 \leq \frac{B(n)}{\sqrt{M}} \exp\left(-2\left(2\frac{x}{c}\right)^n |x|\right) \text{ if } |x| < \left(1 + \frac{c - 1}{4}\right) \log M. \quad (4.16)$$

On the other hand by (4.14)

$$I_2 \leq \frac{\tilde{B}^2(n)\sqrt{\pi}}{M} \int \exp\left(-2\left(2\frac{x}{c}\right)^n \left(\frac{x}{c}u + \left|\frac{x}{c} - u\right|\right)\right) du =$$

$$= \frac{\tilde{B}^2(n)\sqrt{\pi}}{M} \left(2\frac{1}{c} |x| + 1\right) \frac{\left(2\frac{x}{c}\right)^n}{2} \exp\left(-2\left(2\frac{x}{c}\right)^n |x|\right),$$

hence

$$I_2 \leq \frac{B(n)}{\sqrt{M}} \exp\left(-2\left(2\frac{x}{c}\right)^n |x|\right) \text{ if } |x| < \left(1 + \frac{c - 1}{4}\right) \log M. \quad (4.17)$$

Relations (4.15), (4.15)', (4.16) and (4.17) imply (4.13). On the other hand we get by integrating (4.9) that

$$\left|\int_{\mathbb{R}^2 - A} \exp\left(-\frac{u^2}{cn} - \frac{1}{v^2}\right) f(l_{n,M}(x, u, v)) f(l_{n,M}(x, u, v)) du dv\right| \leq$$

$$\leq \frac{B(n)}{\sqrt{M}} \exp\left(-2\left(2\frac{x}{c}\right)^n |x|\right)$$

for $|x| < \left(1 + \frac{c - 1}{4}\right) \log M$. (Observe that in this case we make a negligible error by omitting the term $-\frac{x^2}{cn+1}\sigma_0$ from the exponent.) This relation together with (4.13) imply Lemma 2 in the case $j = 0$.

To investigate the cases $j = 1, 2$ we need the following identities

$$\frac{d}{dx} n\left(x, \left(\frac{c}{\sqrt{2}}\right)^n\sigma_0\right) =$$

$$= \lambda^{n-1}_n \frac{2}{c} \int \exp\left(-\frac{u^2}{cn}\right) n\left(x, \left(\frac{c}{\sqrt{2}}\right)^n\sigma_0\right) n\left(x, -u, \left(\frac{c}{\sqrt{2}}\right)^n\sigma_0\right) du \quad (4.18)$$
\[ \frac{d^2}{dx^2} n \left( x, \left( \frac{c}{\sqrt{2}} \right)^{n+1} \sigma_0 \right) = \]
\[ = \lambda_n^{-1} \cdot \frac{4}{c^2} \int \exp \left( - \frac{u^2}{c^2} \right) n' \left( \frac{x}{c} + u, \left( \frac{c}{\sqrt{2}} \right)^n \sigma_0 \right) n' \left( \frac{x}{c} - u, \left( \frac{c}{\sqrt{2}} \right)^n \sigma_0 \right) du - \]
\[ - \frac{4}{c^{n+2}} \int u \exp \left( - \frac{u^2}{c^2} \right) n' \left( \frac{x}{c} + u, \left( \frac{c}{\sqrt{2}} \right)^n \sigma_0 \right) n \left( \frac{x}{c} - u, \left( \frac{c}{\sqrt{2}} \right)^n \sigma_0 \right) du, \tag{4.18}' \]

where \( n'(x, \sigma) \) denotes the first derivative of the normal density \( n(x, \sigma) \). They can be obtained by differentiating the identity
\[ n \left( x, \left( \frac{c}{\sqrt{2}} \right)^{n+1} \sigma_0 \right) = \]
\[ = \lambda_n^{-1} \int \exp \left( - \frac{u^2}{c^2} \right) n \left( \frac{x}{c} + u, \left( \frac{c}{\sqrt{2}} \right)^n \sigma_0 \right) n \left( \frac{x}{c} - u, \left( \frac{c}{\sqrt{2}} \right)^n \sigma_0 \right) du. \]

Lemma 2 in the case \( j = 1, 2 \) can be obtained similarly to the case \( j = 0 \), only in this case formulas (4.18) and (4.18)' have to be compared with formulas (4.10) and (4.10)' in the domain \((u, v) \in A\). In this comparison the inequality
\[ \left( M + \frac{x}{c^{n+1}} \pm \frac{u}{c^n} \right) \left[ \left( M + \frac{x}{c^{n+1}} \pm \frac{u}{c^n} \right)^2 + \frac{v^2}{c^n} \right]^{-1/2} \leq \frac{10c^{-n}}{M^{3/2}} \]
\[ \text{if } |x| < \left( 1 + \frac{c-1}{4} \right) \log M, \quad (u, v) \in A \]

can be applied.

**Proof of Proposition 1.** — Let us assume that Proposition 1 holds for \( n, n < N \). We shall prove it for \( n + 1 \). We have
\[ f_{n+1}(x) = Q_{n,M_n} f_n(x) = \frac{1}{A_n} Q_{n,M_n} f_n(x + m_n) \]
with \( A_n = \int_{-c^{n+1}M_n}^{\infty} Q_{n,M_n} f_n(x) dx \), and \( m_n = \frac{1}{A_n} \int_{-c^{n+1}M_n}^{\infty} f_n(x) dx \). We apply Lemmas 1 and 2 with the choice \( f = f_n \) and \( M = M_n \). Then we get
\[ A_n = \int_{|x| < \log M_n} + \int_{|x| > \log M_n} = \lambda_n + O \left( \frac{B(n+1)}{\sqrt{M_n}} \right) \]
where \( \lambda_n \) is defined in Lemma 2, and similarly

\[
m_n = \frac{1}{A_n} \int x \left[ \tilde{Q}_{n,M_n} f_n(x) - \lambda_n \nu \left( x, \left( \frac{c}{\sqrt{2}} \right)^n \sigma_0 \right) \right] dx + O \left( \frac{1}{M_n} \right) = O \left( \frac{B(n+1)}{\sqrt{M_n}} \right).
\]

Then, since \( M_{n+1} = M_n + m_n c^{-(n+1)} \), Lemmas 1 and 2 clearly imply Proposition 1 for \( n+1 \).

**Proof of the Corollary.**

a) Proof of formula (3.6).

Let us first consider the case \(|s| < 2 \left( \frac{\sqrt{2}}{c} \right)^n, |t| < 10 \left( \frac{\sqrt{2}}{c} \right)^n \). If \( \tilde{M}_0 \) is sufficiently large then so are \( M_n \) \( n \leq N \). In this case relations (3.2) and (3.3) imply that the functions \( \phi_n(x), f_n(x) \) and \( \phi_d f_n(x) \) are close to each other, and the relations

\[
\left| \frac{d^j}{dx^j} \left[ \phi_d f_n(x) - \nu \left( x, \left( \frac{c}{\sqrt{2}} \right)^n \sigma_0 \right) \right] \right| \leq 10^{-50} 2^{-n} \exp \left( -2 \left( \frac{2}{c} \right)^n |x| \right) \quad (4.19)
\]

for \( |x| < 50 c^{n/2}, j = 0, 1, 2, n \leq N \) and

\[
\left| \frac{d^j}{dx^j} \phi_d f_n(x) \right| \leq \left| \frac{d^j}{dx^j} \nu \left( x, \left( \frac{c}{\sqrt{2}} \right)^n \sigma_0 \right) \right| + 10^{-50} 2^{-n} \exp \left( -2 \left( \frac{2}{c} \right)^n |x| \right) \quad (4.20)
\]

for \( x \in \mathbb{R}^1, j = 0, 1, 2, n \leq N \) hold true. Since

\[
\int \left[ \phi_d f_n(x) - \nu \left( x, \left( \frac{c}{\sqrt{2}} \right)^n \sigma_0 \right) \right] dx = \int x \left[ \phi_d f_n(x) - \nu \left( x, \left( \frac{c}{\sqrt{2}} \right)^n \sigma_0 \right) \right] dx = 0
\]

hence

\[
\tilde{\phi}_n(f_n(t + is)) = \int \exp(itx - sx) \phi_n(f_n)dx =
\]

\[
= \int \exp(itx - sx) \nu \left( x, \left( \frac{c}{\sqrt{2}} \right)^n \sigma_0 \right) dx + \int \exp(itx - sx) \left[ \phi_n(f_n(x) - \nu \left( x, \left( \frac{c}{\sqrt{2}} \right)^n \sigma_0 \right) \right] dx =
\]

\[
= \exp \left( \frac{(s - it)^2}{2} \left( \frac{c^2}{2} \sigma_0^2 \right) \right) + \int \left[ \exp(itx - sx) - 1 - (it - s)x \right] \left[ \phi_n(f_n(x) - \nu \left( x, \left( \frac{c}{\sqrt{2}} \right)^n \sigma_0 \right) \right] dx = I_1 + I_2.
\]
Since
\[ | \exp(itx - sx) - 1 - (it - s)x| \leq (s^2 + t^2)x^2 \exp(|sx|) \]
we get from (4.19) and (4.20) (assuming that \( M_n \) is sufficiently large) that
\[ I_2 \leq (s^2 + t^2) \left[ 10^{-50} \cdot 2^{-n} \int x^2 \exp \left( |sx| - \left( \frac{2}{c} \right)^n |x| \right) dx + \right. \]
\[ + 2 \int_{|x| > 50e^{n/2}} x^2 \exp(|sx|) \left( x, \left( \frac{c}{\sqrt{2}} \right)^n \sigma_0 \right) dx \leq 10^{-40} \left( \frac{c^2}{2} \right)^n (s^2 + t^2). \]
Thus we get that
\[ | \tilde{\phi}_n(f_n)(t + is) | \leq \exp \left( \left( \frac{c^2}{2} \right)^n \frac{s^2 - t^2}{2} \frac{\sigma_0^2}{\sigma_0^2} + 10^{-40} \left( \frac{c^2}{2} \right)^n (s^2 + t^2) \right). \]
If \( 0 < T < \frac{1}{10} \) then \( \frac{5}{8} < \sigma_0^2 < \frac{7}{8} \), and we can write
\[ | \tilde{\phi}_n(f_n)(t + is) | \leq \exp \left( \left( \frac{c^2}{2} \right)^n \frac{s^2 - t^2}{2} \frac{\sigma_0^2}{\sigma_0^2} \left( 1 + \frac{1}{100} \left( \frac{c^2}{2} \right)^n (s^2 + t^2) \right) \right) \leq \]
\[ \leq \exp \left[ \left( \frac{c^2}{2} \right)^n \frac{s^2 - \frac{1}{3} \left( \frac{c^2}{2} \right)^n t^2}{1 + \alpha_n t^2} \right] \]
if \( |s| < 2 \left( \frac{\sqrt{2}}{c} \right)^n \), \( |t| < 10 \left( \frac{\sqrt{2}}{c} \right)^n \).

In the case \( |s| < 2 \left( \sqrt{2}/c \right)^n \), \( |t| > 10 \left( \frac{\sqrt{2}}{c} \right)^n \) we get, integrating by parts twice, that
\[ \tilde{\phi}_n(f_n)(t + is) = \frac{1}{(t + is)^2} \int \frac{d^2}{dx^2} (\phi_n(f_n)(x)) \exp(itx - sx)dx, \]
and by formula (4.20)
\[ \left| \int \exp(itx - sx) \frac{d^2}{dx^2} \phi_n(f_n)(x)dx \right| \leq \int \exp(|sx|) \left[ \frac{d^2}{dx^2} \left( x, \left( \frac{c}{\sqrt{2}} \right)^n \sigma_0 \right) \right] + \]
\[ + 10^{-50} \cdot 2^{-n} \exp \left( -2 \left( \frac{2}{c} \right)^n |x| \right) dx \leq 10 \left( \frac{c^2}{2} \right)^n. \]
Hence
\[ | \tilde{\phi}_n(f_n)(t + is) | \leq \frac{10 \left( \frac{c^2}{2} \right)^n}{t^2} \leq \frac{1}{1 + \alpha_n t^2} \leq \frac{\exp \beta_n s^2}{1 + \alpha_n t^2} \]
also in the case \( |s| < 2 \left( \sqrt{2}/c \right)^n \), \( |t| > 10 \left( \frac{\sqrt{2}}{c} \right)^n \).

b) Proof of formula (3.7).
By formula (3.2) we have for $|x| < \log M_n$
\[
\left| \frac{d^j}{dx^j} f_n(x) \right| \leq \frac{B(n)}{\sqrt{M_n}} \exp \left( - \left( \frac{2}{c} \right)^n |x| \right) + \left| \frac{d^j}{dx^j} \left( x, \left( \frac{c}{\sqrt{2}} \right)^n \sigma_0 \right) \right|.
\]

On the other hand
\[
\frac{B(n)}{\sqrt{M_n}} \exp \left( - \left( \frac{2}{c} \right)^n |x| \right) \leq \frac{1}{\beta_n^{(j+1)/2}} \exp \left( - \frac{1}{\sqrt{\beta_n}} \left| 2x + \frac{x^2}{\sqrt{c^2 M_n}} \right| \right),
\]
and
\[
\left| \frac{d^j}{dx^j} \left( x, \left( \frac{c}{\sqrt{2}} \right)^n \sigma_0 \right) \right| \leq \left( \frac{\sqrt{2}}{c} \right)^{n(j+1)} \left( 1 + \left( \frac{\sqrt{2}}{c} \right)^n |x| \right) \exp \left( - \frac{1}{2} \left( \frac{2}{c^2} \right)^n x^2 \sigma_0 \right) = \\
= \frac{1}{\beta_n^{(j+1)/2}} \left( 1 + \left( \frac{|x|}{\sqrt{\beta_n}} \right)^j \right) \exp \left( - \frac{1}{2} \left( \frac{|x|}{\sqrt{\beta_n \sigma_0}} \right)^2 - 8 \sigma_0^2 + 8 \sigma_0^2 \right) \leq \\
\leq \frac{1}{\beta_n^{(j+1)/2}} \left( 1 + \frac{|x|^j}{\beta_n^{(j+1)/2}} \right) \exp \left( - \frac{4|x|}{\sqrt{\beta_n}} + 8 \sigma_0^2 \right) \leq \\
\leq \frac{9999}{\beta_n^{(j+1)/2}} \exp \left( - \frac{1}{\sqrt{\beta_n}} \left| 2x + \frac{x^2}{\sqrt{c^2 M_n}} \right| \right),
\]
for $j = 0, 1, 2$. If $|x| > \log M_n$, $x > -c^2 M_n$ we get from (3.3) that
\[
\left| \frac{d^j}{dx^j} f_n(x) \right| \leq \\
\leq B(n) \exp \left( - \frac{1}{\sqrt{\beta_n}} \left| 2x + \frac{x^2}{\sqrt{c^2 M_n}} \right| \right) \exp \left[ \left( \frac{\sqrt{2}}{c} \right)^n \left( \frac{2}{c^2} \right)^n \left| 2x + \frac{x^2}{\sqrt{c^2 M_n}} \right| \right] \leq \\
\leq \frac{1}{\beta_n^{(j+1)/2}} \exp \left( - \frac{1}{\sqrt{\beta_n}} \left| 2x + \frac{x^2}{\sqrt{c^2 M_n}} \right| \right).
\]

5. THE PROOF OF PROPOSITION 2

We prove Proposition 2 with the help of a series of Lemmas. Lemmas 3, 4, 5 and 6 enable us to estimate the functions $Q_{n,M} f(x)$, $T_M \phi_n(f)(x)$ together with their difference. We can consider their normalization $Q_{n,M} f(x)$ and $T_M \phi_n(f)(x)$ with the help of Lemma 7.

LEMMA 3. — Given some positive integer \( n \) and real numbers \( \beta > 0 \), \( M > 10^6 \) let \( f \in \mathcal{A}_{n,M} \) be such that

\[
\left| \frac{d^j}{dx^j} f(x) \right| \leq \frac{C}{\beta^{(j+1)/2}} \exp \left( -\frac{1}{\sqrt{\beta}} \left| 2x + \frac{x^2}{c^n M} \right| \right) \text{ for } x > -e^n M, j = 0, 1, 2. \tag{5.1}
\]

There exists some threshold \( n_0(c, C) \) such that if \( n > n_0(c, C) \), and

\[
\beta > \frac{4}{(1 - \varepsilon)M^2} \text{ with some } \frac{1}{2} > \varepsilon > 10c^{-n/4}, \quad \beta < 100 \tag{5.2}
\]

then

\[
\left| \frac{d^j}{dx^j} \overline{Q}_{n,M} f(x) \right| \leq C_1(\varepsilon) \frac{C^2}{\beta^{(j+1)/2}} \exp \left( -\frac{2(1 - \varepsilon)}{c \sqrt{\beta}} \left| 2x + \frac{x^2}{c^{n+1} M} \right| \right), j = 0, 1, 2
\]

for \( x > -c^{n+1} M \) with some \( C_1(\varepsilon) > 0 \) depending only on \( \varepsilon \).

Proof of Lemma 3. — Let us first consider the case \( j = 0 \). It follows from (4.8)' and (5.1) that

\[
\exp \left( -\frac{u^2}{c^n} - v^2 \right) f(l^+_m(x, u, v)) f(l^-_m(x, u, v)) \leq \frac{C^2}{\beta} \exp \left( -\frac{2}{c \sqrt{\beta}} \left| 2x + \frac{x^2}{c^{n+1} M} \right| \right) \exp \left( -\frac{(u^2 + v^2)(1 - 2/c \sqrt{\beta M})}{c^n} \right) \tag{5.3}
\]

Since \( 1 - \frac{2}{\sqrt{\beta M}} > 1 - \sqrt{1 - \varepsilon} > 0 \) by (5.2) we get by integrating (5.3) that

\[
|\overline{Q}_{n,M} f(x)| \leq C^2c^{n/2}\pi \left( 1 - \frac{2}{\sqrt{\beta M}} \right)^{-1} \exp \left( -\frac{2}{c \sqrt{\beta}} \left| 2x + \frac{x^2}{c^{n+1} M} \right| \right). \tag{5.4}
\]

For \( \{ x \mid x > -c^{n+1} M, |x| > c^{n/2} \sqrt{M} \} \) relation (5.4) implies Lemma 3. since in this case \( \exp \left( -\frac{\varepsilon}{\sqrt{\beta}} \left| 2x + \frac{x^2}{c^n M} \right| \right) \leq C(\varepsilon) \sqrt{\beta}c^{-n/2} \). In order to prove Lemma 3 for small \( |x| \) we need a different bound on \( \overline{Q}_{n,M} f(x) \). We claim that for \( |x| < c^{n/2} \sqrt{M} \)

\[
\exp \left( -\frac{u^2}{c^n} + v^2 \right) f(l^+_m(x, u, v)) f(l^-_m(x, u, v)) \leq \frac{C^2}{\beta} \exp \left( -\frac{2(1 - \varepsilon)}{c \sqrt{\beta}} \left| 2x + \frac{x^2}{c^{n+1} M} \right| \right) \exp \left( -\frac{3 |u| \varepsilon}{\sqrt{\beta}} \right). \tag{5.3}'
\]
Indeed, by relation (4.8)

\[
\left[ 2l_{n,M}^+(x, u, v) + \frac{l_{n,M}^+(x, u, v)^2}{c^n M} \right] - \left[ 2l_{n,M}^-(x, u, v) + \frac{l_{n,M}^-(x, u, v)^2}{c^n M} \right] = \\
= \left| 4u + \frac{4ux}{c^{n+1} M} \right| > 3 |u|
\]

for $|x| < c^{n/2} \sqrt{M}$, and in this case this relation, (4.8)' and the inequality

\[
\exp \left( -\frac{u^2}{c^n} - v^2 \right) f(l_{n,M}^+(x, u, v)) f(l_{n,M}^-(x, u, v)) \leq \\
\leq \frac{C^2}{\beta} \exp \left\{ -\frac{1 - \varepsilon}{\sqrt{\beta}} \left( 2l_{n,M}^+(x, u, v) + \frac{l_{n,M}^+(x, u, v)^2}{c^n M} \right) \right. \\
\left. + \left| 2l_{n,M}^-(x, u, v) + \frac{l_{n,M}^-(x, u, v)^2}{c^n M} \right| - \frac{\varepsilon}{\sqrt{\beta}} \left[ 2l_{n,M}^+(x, u, v) + \frac{l_{n,M}^+(x, u, v)^2}{c^n M} \right] \\
\right. \\
- \left. \left[ 2l_{n,M}^-(x, u, v) + \frac{l_{n,M}^-(x, u, v)^2}{c^n M} \right] \right\}
\]

imply (5.3)'. For $|x| < c^{n/2} \sqrt{M}$ we get Lemma 3 with $j = 0$ by integrating relation (5.3)'. (In this case the multiplying factor before the exponent will be appropriate for our purposes because of the term $\exp \left( -\frac{3\varepsilon |u|}{\sqrt{\beta}} \right)$.)

The cases $j = 1, 2$ are similar, only in these cases formulas (4.11) and (4.11)' have to be applied.

**Lemma 4.** Let $f$, $\beta$, $M$ and $n$ satisfy the conditions of Lemma 3, and let $\beta > 4^{-n}$, \( \int_{-c^n M}^\infty f(x)dx = 1, \int_{-c^n M}^\infty xf(x)dx = 0. \) Then

\[
\left| \frac{d}{dx} \left[ \bar{Q}_{n,M} f(x) - \bar{Q}_{n,M} \phi_n(f)(x) \right] \right| \\
\leq 2^{-n} \frac{C^2 C_1(\varepsilon)}{\beta^{(1+1)/2}} \exp \left( -\frac{2(1-\varepsilon)}{c^\sqrt{\beta}} \left( 2x + \frac{x^2}{c^{n+1} M} \right) \right) \quad j = 0, 1, 2, \quad x > -c^{n+1} M
\]

where the regularization $\phi_n(f)(x)$ is defined in the Definition given in Section 3.

**Proof of Lemma 4.** We have

\[
|A_n - 1| = \left| \int_{-c^n M}^\infty \left[ \phi \left( \frac{1}{100} c^{-n/2} x \right) - 1 \right] f(x)dx \right| \leq \int_{|x| > 100c^{n/2}} f(x)dx \leq \\
\leq \int_{|x| > 100c^{n/2}} \frac{C}{\sqrt{\beta}} \exp \left( -\frac{|x|}{\sqrt{\beta}} \right) dx \leq 2^{-n}
\]
if \( n > n_0(c, C) \) is sufficiently large. Similarly,

\[
|A_n B_n| = \left| \int_{-c^nM}^{\infty} x f(x) [\phi_n(x) - 1] dx \right| \leq \int_{|x| > 100c^{n/2}} |x| \exp \left( -\frac{|x|}{\sqrt{\beta}} \right) dx < \sqrt{\beta} 
\]

It follows from the above estimates and relation (5.1) that

\[
\left| \frac{d^j}{dx^j} [f(x) - \phi_n(f)(x)] \right| \leq \frac{2^{-n}C}{\beta^{(j+1)/2}} \exp \left( -\frac{1}{\sqrt{\beta}} \left| 2x + \frac{x^2}{c^nM} \right| \right),
\]

\( j = 0, 1, 2, x > -c^nM \) (5.5)

and

\[
\left| \frac{d^j}{dx^j} \phi_n(f)(x) \right| \leq \frac{C}{\beta^{(j+1)/2}} \exp \left( -\frac{1}{\sqrt{\beta}} \left| 2x + \frac{x^2}{c^nM} \right| \right),
\]

\( j = 0, 1, 2, x > -c^nM. \) (5.6)

The proof of Lemma 3 with some slight changes yields that relations (5.5) and (5.6) imply the inequalities

\[
\left| \frac{d^j}{dx^j} \left[ \int \exp \left( -\frac{u^2}{c^n} - \frac{v^2}{c^n} \right) f_i(l_{n,M}^r(x,u,v)) f_i(l_{n,M}^r(x,u,v)) - \phi_n(f)(l_{n,M}^r(x,u,v)) \right] du dv \right|
\]

\[
\leq \frac{2^{-n}C(e)c^2}{\beta^{(j+1)/2}} \exp \left( \frac{2(1-\beta)}{c\sqrt{\beta}} \left| 2x + \frac{x^2}{c^{n+1}M} \right| \right), \quad x > -c^{n+1}M
\]

for \( j = 0, 1, 2, i = 1, 2 \) with \( f_1(x) = f(x) \), \( f_2(x) = \phi(f)(x) \). Because of the special quadratic form of the operator \( Q_{n,M} \) these estimates imply Lemma 4.

**Lemma 5.** — **Under the conditions of Lemma 4**

\[
\left| \frac{d^j}{dx^j} (\overline{Q}_{n,M} \phi_n(f)(x) - \overline{T}_M \phi_n(f)(x)) \right|
\]

\[
\leq \frac{C(e)c^2}{\beta^{(j+1)/2}} c^{-n} \exp \left( -\frac{2(1-\beta)}{c\sqrt{\beta}} \left| 2x + \frac{x^2}{c^{n+1}M} \right| \right) \quad (5.7)
\]

for \( x > -c^{n+1}M \), \( j = 0, 1, 2 \).

**Proof of Lemma 5.** — Let us first consider the case \( j = 0 \). The main step of the proof is to check (5.7) for small \( x \). The main contribution to the integrals \( \overline{Q}_{n,M} \phi_n(f)(x) \) and \( \overline{T}_M \phi_n(f)(x) \) is given by small \( u \) and \( v \), and for such values we need a good asymptotics of the integrands. Let us consi-
der the case $|x| < c^{n/2} \sqrt{M}$, define the set $D(n) = \{ (u,v), |u| < 10c^{n/2} \sqrt{M}, \frac{v^2}{M} < 10c^{n/2} \sqrt{M} \}$, and give a good bound on

$$J(x,u,v) = \exp \left( - \frac{u^2}{c^n} - v^2 \right) \phi_n(f)(l_{n,M}(x,u,v)) \phi_n(f)(l_{n,M}(x,u,v)) -$$

$$- \exp (- v^2) \phi_n(f) \left( \frac{x}{c} + u + \frac{v^2}{2M} \right) \phi_n(f) \left( \frac{x}{c} - u + \frac{v^2}{2M} \right).$$

We claim that

$$|J(x,u,v)| \leq \frac{C_1 C^2}{\beta} \left( \frac{u^2 + x^2}{c^n} + \frac{v^4 + x^6}{c^3M} + \left( \frac{v^4}{M c^n} \right)^3 \right) \cdot \exp \left( - \frac{2}{\sqrt{\beta}} \left| \frac{x}{c} + u + \frac{v^2}{2M} \right| - \frac{2}{\sqrt{\beta}} \left| \frac{x}{c} - u + \frac{v^2}{2M} \right| - v^2 \right) (5.8)$$

if $|x| < c^{n/2} \sqrt{M}$ and $(u,v) \in D(n)$.

Indeed, by (5.6) (the term $\frac{x^2}{c^n M}$ can be dropped from the exponent in (5.6)) and (4.12)

$$|\phi_n(f)(l_{n,M}(x,u,v)) - \phi_n(f) \left( \frac{x}{c} \pm u + \frac{v^2}{2M} \right)|$$

$$\leq \frac{C C^2}{\beta} \left( \frac{u^2 + x^2}{c^n} + \frac{v^4 + x^6}{c^3M} \right) \sup_{\xi \in l_{n,M}(x,u,v), \xi, x \pm u + \frac{v^2}{2M}} \left| \frac{d}{d\xi} \phi_n(f)(\xi) \right|$$

$$\leq \frac{C C^2}{M \beta} c^{-n} \left( \frac{v^2}{M} + x^2 + u^2 \right) \exp \left( - \frac{2}{\sqrt{\beta}} \left| \frac{x}{c} \pm u + \frac{v^2}{2M} \right| \right) (5.9)$$

and

$$|\exp(-u^2/c^n) - 1| \leq u^2/c^n. (5.10)$$

First we show that

$$|J(x,u,v)| \leq \left\{ \left( 1 + \frac{u^2}{c^n} \right) \left[ \phi_n(f) \left( \frac{x}{c} + u + \frac{v^2}{2M} \right) + \frac{C C^2}{\sqrt{\beta}} c^{-n} \left( \frac{v^4}{M} + x^2 + u^2 \right) \right] \right.$$ 

$$\exp \left( - \frac{2}{\sqrt{\beta}} \left| \frac{x}{c} + u + \frac{v^2}{2M} \right| \right) \left[ \phi_n(f) \left( \frac{x}{c} - u + \frac{v^2}{2M} \right) + \frac{C C^2}{\sqrt{\beta}} c^{-n} \left( \frac{v^4}{M} + x^2 + u^2 \right) \right]$$

$$\exp \left( - \frac{2}{\sqrt{\beta}} \left| \frac{x}{c} - u + \frac{v^2}{2M} \right| \right) \left[ \phi_n(f) \left( \frac{x}{c} + u + \frac{v^2}{2M} \right) \phi_n(f) \left( \frac{x}{c} - u + \frac{v^2}{2M} \right) \right]$$

$$\exp (- v^2). (5.11)$$

Indeed, write
\[ \phi_n(f)(l^+_{n,M}(x, u, v)) = \phi_n(f)\left(\frac{x}{c} + u + \frac{v^2}{2M}\right) + \varepsilon_1, \]
\[ \phi_n(f)(l^-(x, u, v)) = \phi_n(f)\left(\frac{x}{c} - u + \frac{v^2}{2M}\right) + \varepsilon_2, \quad \exp \left(- \frac{u^2}{c^2}\right) = 1 + \varepsilon_3 \]
in the definition of \( J(x, u, v) \), and carry out all multiplication both in the expression \( J(x, u, v) \) and the right hand side of (5.11). Then the relations \( \frac{1}{M\beta} < \frac{1}{\sqrt{\beta}} \), (5.9) and (5.10) imply that each term in the expression \( J(x, u, v) \) is majorized by the corresponding term at the right hand side of (5.11). Similar argument shows that the right hand side of (5.11) increases if \( \phi_n(f)\left(\frac{x}{c} \pm u + \frac{v^2}{2M}\right) \) is replaced by its upper bound
\[ C\beta^{-1/2}\exp\left(-\frac{2}{\sqrt{\beta}}\left|\frac{x}{c} \pm u + \frac{v^2}{2M}\right|\right). \]
(This upper bound follows from (5.6).) Hence we get that
\[ |J(x, u, v)| \leq \exp\left\{-\frac{2}{\sqrt{\beta}}\left|\frac{x}{c} + u + \frac{v^2}{2M}\right| - \frac{2}{\sqrt{\beta}}\left|\frac{x}{c} - u + \frac{v^2}{2M}\right| - v^2\right\} \]
\[ \frac{CC^2}{\beta} \left(1 + \frac{u^2}{c^2}\right)\left(1 + c^{-n}\left(\frac{v^4}{M} + x^2 + u^2\right)^2\right) - 1 \]
and this estimate implies (5.8).

Since \( \frac{2}{\sqrt{\beta} M} - v^2 < - (1 - \sqrt{1 - \varepsilon})v^2 \) by (5.2) relation (5.8) yields that
\[ |J(x, u, v)| \leq \frac{C_1C^2}{\beta} c^{-n}\left(1 + u^2 + x^2 + \frac{u^6 + x^6}{c^{2n}}\right)\left(1 + \frac{v^4}{M} + \frac{v^{12}}{c^{2n}M^3}\right) \]
\[ \exp\left\{-\frac{2}{\sqrt{\beta}}\left|\frac{x}{c} + u\right| + \left|\frac{x}{c} - u\right| - (1 - \sqrt{1 - \varepsilon})v^2\right\} \] (5.8)' if \( |x| < c^{n/2}\sqrt{M} \) and \((u, v) \in D(n)\).

Integrating this inequality and using the change of variables \( \bar{u} = \frac{u}{\sqrt{\beta}} \) we get that
\[ \int_{D(n)} |J(x, u, v)| du dv \leq \frac{C_1C^2}{\sqrt{\beta}} c^{-n}\left(1 + x^2 + \frac{x^6}{c^{2n}} + \beta u^2 + \beta^3 \frac{u^6}{c^{2n}}\right) \]
\[ \exp\left(-2\left|\frac{x}{c\sqrt{\beta}} + u\right| - 2\left|\frac{x}{c\sqrt{\beta}} - u\right|\right) \int \left(1 + \frac{v^4}{M} + \frac{v^{12}}{c^{2n}M^3}\right) \exp\left(- (1 - \sqrt{1 - \varepsilon})v^2\right) dv \leq (5.12) \]
\[ \leq \frac{C(\varepsilon)C^2}{\sqrt{\beta}} c^{-n} \exp \left( - \frac{4(1 - \varepsilon/3)}{c\sqrt{\beta}} |x| \right) \]
\[ \leq \frac{C(\varepsilon)C^2}{\sqrt{\beta}} c^{-n} \exp \left( - \frac{2(1 - \varepsilon)}{c\sqrt{\beta}} \left( 2x + \frac{x^2}{c^{n+1}M} \right) \right) \text{ if } |x| < c^{n/2}M. \]

Observe that if \(|x| < c^{n/2}M \) and \((u, v) \notin D(n)\) then either
\[ \left| \frac{x}{c} + u + \frac{v^2}{2M} \right| > 200c^{n/2} \text{ or } \left| \frac{x}{c} - u + \frac{v^2}{2M} \right| > 200c^{n/2} \]

therefore
\[ \int_{R^2 - D(n)} \exp \left( -v^2 \right) \phi_n(f) \left( \frac{x}{c} + u + \frac{v^2}{2M} \right) \phi_n(f) \left( \frac{x}{c} - u + \frac{v^2}{2M} \right) dudv = 0 \]
\[ \text{if } |x| < c^{n/2}M. \quad (5.13) \]

Indeed, if \(\frac{v^2}{M} > 10c^{n/2} \sqrt{M}\) then
\[ \left| \frac{x}{c} + u \text{ sign } u + \frac{v^2}{2M} \right| > \frac{v^2}{2M} - \frac{|x|}{c} > 4c^{n/2} \sqrt{M} > 200c^{n/2}, \]

and if \(|u| > 10c^{n/2} \sqrt{M}, \)
\[ \frac{v^2}{M} < 10c^{n/2} \sqrt{M} \text{ then } \left| \frac{x}{c} + u + \frac{v^2}{2M} \right| > |u| - |x| - \frac{v^2}{2M} > 200c^{n/2}. \]

On the other hand relation (5.3)', for the function \(\phi_n(f)\), yields that
\[ \int_{R^2 - D(n)} \exp \left( - \left( \frac{u^2}{c^2} + v^2 \right) \right) \phi_n(f)(l^+_n(x, u, v)) \phi_n(f)(l^-_n(x, u, v)) dudv \leq \]
\[ \leq \frac{C^2C(\varepsilon)}{\sqrt{\beta}} \ c^{-n} \exp \left( - \frac{2(1 - \varepsilon)}{\sqrt{\beta}} \left( 2x + \frac{x^2}{c^{n+1}M} \right) \right) \text{ if } |x| < c^{n/2} \sqrt{M}. \quad (5.13)' \]

Relations (5.12), (5.13) and (5.13)' imply Lemma 5 for \(|x| < c^{n/2} \sqrt{M}, \)
\[ \text{if } |x| > c^{n/2} \sqrt{M} \text{ then relation (5.4) for the function } \phi_n(f) \text{ gives that} \]
\[ |\overline{Q}_{n,M} \phi_n(f)(x)| \leq \frac{C(\varepsilon)C^2}{\sqrt{\beta}} c^{-n} \exp \left( - \frac{2(1 - \varepsilon)}{c\sqrt{\beta}} \left( 2x + \frac{x^2}{c^{n+1}M} \right) \right) \quad (5.14) \]

for \(|x| > c^{n/2} \sqrt{M}, x > -c^{n+1}M. \)
If \( x > c^{n/2} \sqrt{M} \) then \( \frac{x}{c} + u \) \( \text{sign} \) \( u \) \( + \frac{v^2}{2M} \) \( > 200c^{n/2} \) \( (M > 10^6) \), hence

\[
\phi_n(f) \left( \frac{x}{c} + u \right) \text{sign} u \left( + \frac{v^2}{2M} \right) = 0, \text{ and}
\]

\[
\overline{T}_m \phi_n(f)(x) = 0 \quad \text{if} \quad x > c^{n/2} \sqrt{M}. \quad (5.15)
\]

If \( x < -c^{n/2} \sqrt{M} \) then relation (5.6) \( \left( \text{dropping the term} \ \frac{x^2}{c^n M} \ \text{from the}
\right. \)

exponent, what can be done, since \( \phi_n(f)(x) = 0 \) \( \text{for} \ |x| > 200c^{n/2} \) \( \text{and} \ (5.2) \)

imply that

\[
|\overline{T}_m \phi_n(f)(x)| \leq \frac{C^2}{\beta} \int \exp \left\{ -v^2 - \frac{2}{\sqrt{\beta}} \left( \left| \frac{x}{c} + u + \frac{v^2}{2M} \right| + \left| \frac{x}{c} - u + \frac{v^2}{2M} \right| \right) \right\}
\]

\[
dudv \leq \frac{C^2}{\beta} \int \exp \left( -\frac{2}{\sqrt{\beta}} \left( 1 - \frac{\varepsilon}{3} \right) \left( \left| \frac{x}{c} + u \right| + \left| \frac{x}{c} - u \right| \right) \right) du \int \exp(-\sqrt{1-\varepsilon}v^2)
\]

\[
dv \leq \frac{C(\varepsilon)C^2}{\sqrt{\beta}} \left( 1 + \frac{|x|}{\sqrt{\beta}} \right) \exp \left( -\frac{4(1-\varepsilon/3)}{c\sqrt{\beta}} x \right)
\]

\[
\leq \frac{C(\varepsilon)C^2}{\sqrt{\beta}} \exp \left( -\frac{4(1-\varepsilon/2)}{c\sqrt{\beta}} |x| \right).
\]

Hence

\[
|\overline{T}_m \phi_n(f)(x)| \leq \frac{C^2C(\varepsilon)}{\sqrt{\beta}} c^{-n} \exp \left( -\frac{2(1-\varepsilon)}{c\sqrt{\beta}} \left| 2x + \frac{x^2}{c^{n+1}M} \right| \right) \quad (5.15)'
\]

if \( -c^{n+1}M < x < -c^{n/2}M \).

For \( |x| > c^{n/2} \sqrt{M} \), \( x > -c^{n+1}M \), \( j = 0 \) Lemma 5 follows from (5.14), (5.15), (5.15)'.

In the case \( j = 1, 2 \) we compare formulas (4.10) and (4.10)' with the identities

\[
\frac{d}{dx} \overline{T}_m f(x) = \frac{2}{c} \int \exp \left( -v^2 \right) f' \left( \frac{x}{c} + u + \frac{v^2}{2M} \right) f \left( \frac{x}{c} - u + \frac{v^2}{2M} \right) dudv,
\]

\[
\frac{d^2}{dx^2} \overline{T}_m f(x) = \frac{4}{c^2} \int \exp \left( -v^2 \right) f' \left( \frac{x}{c} + u + \frac{v^2}{2M} \right) f' \left( \frac{x}{c} - u + \frac{v^2}{2M} \right) dudv,
\]
and apply the inequalities
\[
\left| \frac{M + \frac{x}{c^{n+1} + \pm u/c^n} - 1}{\sqrt{\left(M + \frac{x}{c^{n+1} + \pm u/c^n} + v^2/c^n\right)^2}} \right| \leq 5 \frac{v^2}{c^n M}, \quad \text{if } |x| < c^{n/2} M, \quad (u, v) \in D(n),
\]
\[
\left| \left(M + \frac{x}{c^{n+1} + \pm u/c^n}\right)^2 \left(M + \frac{x}{c^{n+1} + \pm u/c^n} + v^2/c^n\right)^{-1/2} \right| \leq 1.
\]

For \(j = 1\) almost the same proof works as for \(j = 0\) with some slight modifications. An additional multiplying term \(\frac{1}{\sqrt{\beta}}\) appears in the estimates when we have to bound \(f'\) instead of \(f\). In the case \(j = 2\) we estimate similarly, but we have to show that the second term in (4.10)' is negligible small, it can be bounded by \(\frac{C(e)C^2}{\beta^{3/2}} e^{-\eta} \exp \left( -\frac{2(1 - \varepsilon)}{\sqrt{\beta} c} 2x + \frac{x^2}{c^{n+1} M} \right) \).

This follows from the estimate
\[
\int \frac{|u|}{\sqrt{\beta}} \exp \left( -\frac{u^2}{c^n} - v^2 \right) \left| f'(l_{n,M}^+(x, u, v)) \right| \left| f(l_{n,M}^-(x, u, v)) \right| | du dv \leq \frac{C^2 C(e)}{\beta^{3/2}} \exp \left( -\frac{2 - \varepsilon}{c\sqrt{\beta}} 2x + \frac{x^2}{c^{n+1} M} \right), \quad (5.16)
\]
which can be proved similarly to Lemma 3, by observing that the integrand on the left hand side of (5.16) can be bounded similarly to (5.3) and (5.3)', only \(\frac{1}{\beta}\) must be replaced by \(\frac{1}{\beta^{1/2}}\) and exp \(\left( -\frac{3\varepsilon |u|}{\sqrt{\beta}} \right)\) by \(\frac{1}{\varepsilon} \exp \left( -\frac{2\varepsilon |u|}{\sqrt{\beta}} \right)\) in (5.3)' and the right hand side of (5.3) must be multiplied by \(\beta^{-1} |u|\). (This multiplying term in (5.3) causes no problem, because we need (5.3) only to deduce (5.4) for \(|x| > c^{n/2} \sqrt{M}\), and in this case the pre-exponential term in (5.4) need not be bounded sharply).

**Lemma 6.** — If the functions \(f_1(x)\) and \(f_2(x)\) satisfy the inequalities
\[
\left| \frac{d^j}{dx^j} f_i(x) \right| \leq \frac{C}{\beta^{(j+1)/2}} \exp \left( -\frac{2|x|}{\sqrt{\beta}} \right), \quad j = 0, 1, 2; \quad i = 1, 2
\]
\[
\left| \frac{d^j}{dx^j} [f_1(x) - f_2(x)] \right| \leq \frac{C\delta}{\beta^{(j+1)/2}} \exp \left( -\frac{2|x|}{\sqrt{\beta}} \right), \quad j = 0, 1, 2
\]
for all $x \in \mathbb{R}^1$ with some $C > 0$, $\delta > 0$, $\beta \geq \frac{4}{M^2(1 - \varepsilon)}$ with some $\varepsilon > 0$ then

$$\left| \frac{d^j}{dx^j} [\overline{T}_M f_1(x) - \overline{T}_M f_2(x)] \right| \leq C_1(\varepsilon) \frac{C^2 \delta}{\beta^{(j+1)/2}} \exp \left( - \frac{4(1 - \varepsilon)}{c \sqrt{\beta}} |x| \right)$$

for all $x \in \mathbb{R}^1$ and $j = 0, 1, 2, 3, 4$. In particular, by choosing $f_2(x) = 0$ we get that

$$\left| \frac{d^j}{dx^j} \overline{T}_M f_1(x) \right| \leq C_1(\varepsilon) \frac{C^2}{\beta^{(j+1)/2}} \exp \left( - \frac{4(1 - \varepsilon)}{c \sqrt{\beta}} |x| \right), \quad j = 0, 1, 2, 3, 4.$$

(Observe that we get a bound on the first four derivatives of $\overline{T}_M f_1(x)$ and $\overline{T}_M f_2(x)$ with the help of the first two derivatives of $f_1(x)$ and $f_2(x)$.)

**Proof of Lemma 6.**

We have

$$\frac{d^j}{dx^j} [\overline{T}_M f_1(x) - \overline{T}_M f_2(x)]$$

$$= \left( \frac{2}{c} \right)^j \int e^{-v^2} \left\{ f_1^{(j)} \left( \frac{x}{c} + u + \frac{v^2}{2M} \right) f_1^{(j-n)} \left( \frac{x}{c} - u + \frac{v^2}{2M} \right) - f_2^{(j-n)} \left( \frac{x}{c} - u + \frac{v^2}{2M} \right) \right\} \, du \, dv$$

with $l = \left[ \frac{j}{2} \right]$, where $[\quad]$ denotes integer part.

Hence

$$\left| \frac{d^j}{dx^j} [\overline{T}_M f_1(x) - \overline{T}_M f_2(x)] \right| \leq$$

$$\leq 2 \left( \frac{2}{c} \right)^j C^2 \delta \beta^{-(j+2)/2} \int \exp \left\{ - \frac{2}{\sqrt{\beta}} \left( \left| \frac{x}{c} + u + \frac{v^2}{2M} \right| + \left| \frac{x}{c} - u + \frac{v^2}{2M} \right| \right) \right\} \, du \, dv \leq 2 \left( \frac{2}{c} \right)^j C^2 \delta \beta^{-(j+2)/2} \int \exp \left( - \frac{2}{\sqrt{\beta M}} |x| \right) \, dv. \cdot \int \exp \left( - \frac{2}{\sqrt{\beta M}} \right) \, dv.$$
By calculating the above integrals we get that
\[
\left| \frac{d^j}{dx^j} \left[ \mathcal{T}_M f_1(x) - \mathcal{T}_M f_2(x) \right] \right| \leq \left( \frac{2}{c} \right)^j \frac{C^2 \delta \sqrt{\pi}}{\beta^{(j+1)/2}} \left( 1 - \frac{2}{\sqrt{\beta M}} \right)^{-1/2} \left( 1 + \frac{4 |x|}{c \sqrt{\beta}} \right) \exp \left( - \frac{4 |x|}{c \sqrt{\beta}} \right) \leq \frac{C_1(c_0) C^2}{\beta^{(j+1)/2}} \exp \left( - \frac{4(1 - c_0)}{c \sqrt{\beta}} |x| \right).
\]

Lemma 6 is proved.

**Lemma 7.** — Let \( f, n \) and \( \beta \) satisfy the conditions of Lemma 4. Then
\[
R_0 = \int_{-c_n + 1 M}^\infty \sqrt{Q_{n,M}} f(x) dx = \frac{c \sqrt{\pi}}{2} + \gamma_n,
\]
\[
R_1 = \int_{-c_n + 1 M}^\infty x \sqrt{Q_{n,M}} f(x) dx = -\frac{c^2 \sqrt{\pi}}{8 M} + \delta_n
\]
with \( |\gamma_n| < C_1 C^2 c^{-n}, |\delta_n| < C_1 C^2 c^{-n} \sqrt{\beta} \).

**Proof of Lemma 7.** — We can write both for \( j = 0 \) and \( j = 1 \)
\[
R_j = \int_{-c_n + 1 M}^\infty x^j [\sqrt{Q_{n,M}} f(x) - \sqrt{Q_{n,M}} \phi_n(f)(x)] dx + \int_{-c_n + 1 M}^\infty x^j \left[ \sqrt{Q_{n,M}} \phi_n(f)(x) - \mathcal{T}_M \phi_n(f)(x) \right] dx + \int_{-c_n + 1 M}^\infty x^j \mathcal{T}_M \phi_n(f)(x) dx = I_1^{(0)} + I_2^{(0)} + I_3^{(0)} + I_4^{(0)}. \tag{5.17}
\]

It follows from (2.20) that
\[
I_2^{(0)} = \int \mathcal{T}_M \phi_n(f)(x) dx = \frac{c \sqrt{\pi}}{2}, \quad I_4^{(1)} = \int x \mathcal{T}_M \phi_n(f)(x) dx = -\frac{c^2 \sqrt{\pi}}{8 M}. \tag{5.18}
\]

By applying Lemma 4 and Lemma 5 with \( \varepsilon = \frac{1}{10} \) we get that
\[
|I_1^{(j)}| \leq \frac{2^{-n} C_1 C^2}{\sqrt{\beta}} \int_{-c_n + 1 M}^\infty |x|^j \exp \left( - \frac{|x|}{\sqrt{\beta}} \right) dx \leq 2^{-n} C_1 C^2 \beta^{j/2} \tag{5.19}
\]
\[
|I_2^{(j)}| \leq c^{-n} C_1 C^2 \beta^{j/2} \tag{5.19}'
\]

and by Lemma 6
\[
|I_3^{(j)}| \leq C_1 C^2 \frac{1}{\sqrt{\beta}} \int_{-\infty}^{-c_n + 1 M} |x|^j \exp \left( - \frac{|x|}{\sqrt{\beta}} \right) dx \leq c^{-n} C_1 C^2 \beta^{j/2}. \tag{5.19}''
\]

Relations (5.17)-(5.19)'' imply Lemma 7.
Proof of Proposition 2. — The relation

\[ Q_{n,M} f(x) = \frac{1}{R_0} \overline{Q_{n,M}} f(x + m_n) \]  \hspace{1cm} (5.20)

holds with

\[ m_n = \frac{R_1}{R_0} = -\frac{c}{4M} + \gamma_n \quad \text{with} \quad |\gamma_n| < C_1 c^2 c^{-n} \sqrt{\beta} \]  \hspace{1cm} (5.20)'

(observe that \( \frac{1}{\sqrt{\beta}} < M \)), and this implies (3.19) and (3.19)'. Relation (3.16) follows from (5.20), (5.20)' and Lemma 3, relation (3.17) from Lemma 6 and (2.17).

We claim that

\[ \left| \frac{d^j}{dx^j} \left[ \frac{1}{R_0} \overline{T_M} \phi_n(f)(x + m_n) - T_M \phi_n(f)(x) \right] \right| \leq \frac{C(\varepsilon) C^4}{\beta^{(j+1)/2}} c^{-n} \exp \left( -\frac{4(1 - \varepsilon)}{c \sqrt{\beta}} |x| \right) \]  \hspace{1cm} (5.21)

for \( j = 0, 1, 2 \). Indeed,

\[ T_M \phi_n(f)(x) - \frac{1}{R_0} \overline{T_M} \phi_n(f)(x + m_n) = \left( \frac{2}{c \sqrt{\pi}} - \frac{1}{R_0} \right) \overline{T_M} \phi_n(f)(x + m_n) + \]

\[ + \frac{2}{c \sqrt{\pi}} \left( \overline{T_M} \phi_n(f) \left( x - \frac{c}{4M} \right) - \overline{T_M} \phi_n(f)(x + m_n) \right), \]

and by Lemma 6 and (5.20)'

\[ \left| \frac{d^j}{dx^j} \left[ \overline{T_M} \phi_n(f) \left( x - \frac{c}{4M} \right) - \overline{T_M} \phi_n(f)(x + m_n) \right] \right| \leq \]

\[ \leq \left| m_n + \frac{c}{4M} \right| \left| \frac{d^{j+1}}{dx^{j+1}} \overline{T_M} \phi_n(f)(x) \right|_{x = \xi} \leq \]

\[ \leq \frac{C(\varepsilon) C^4}{\beta^{(j+1)/2}} c^{-n} \exp \left( -\frac{4(1 - \varepsilon)}{c \sqrt{\beta}} |x| \right) \quad \text{with some} \quad \xi \in \left[ x - \frac{c}{4M}, x + m_n \right]. \]

Similarly

\[ \left| \left( \frac{2}{c \sqrt{\pi}} - \frac{1}{R_0} \right) \overline{T_M} \phi_n(f)(x + m_n) \right| \leq \frac{C(\varepsilon) C^4}{\beta^{(j+1)/2}} \exp \left( -\frac{4(1 - \varepsilon)}{c \sqrt{\beta}} |x| \right) \]

and these relations imply (5.21). Relation (3.18) follows from Lemmas 4, 5 and relations (5.20), (5.21).
6. THE PROOF OF PROPOSITION 3
AND SOME OF ITS CONSEQUENCES.
THE SECOND STEP OF THE INDUCTIVE PROCEDURE

We prove Proposition 3 with the help of the following two lemmas.

**Lemma 8.** Under the conditions of Proposition 2 for $|s| < \frac{\sqrt{2}}{c} \frac{2}{\sqrt{\beta}}$.

a) $|\tilde{\phi}_{n+1}(Q_{n,M}f)(t + is) - \tilde{T}_M \tilde{\phi}_n(f)(t + is)| \leq \begin{cases} \leq C_1(C^4 + 1)c^{-n} \beta(s^2 + t^2) & (6.1) \\ \leq C_1(C^4 + 1)c^{-n} \frac{1}{\beta t^2} & (6.2) \end{cases}$

b) $|\tilde{T}_M \tilde{\phi}_n(f)(t + is)| \leq \frac{C_1 C^2}{\beta^2 t^4}$.

**Lemma 9.** If the Fourier transform $\tilde{f}$ of the function $f(x)$ satisfies the inequality

$|\tilde{f}(t + is)| \leq \frac{\exp \beta s^2}{1 + \alpha t^2}$

for $|s| < \frac{2}{\sqrt{\beta}}$, $t \in \mathbb{R}^1$

and $\beta > \frac{9}{M^2}, \alpha > \frac{10^{-12}}{M^2}$ with some $M > 1, \beta > \alpha$ then

a) $\left| \frac{d^j}{dx^j} T_m f(x) \right| \leq \frac{C_1}{\alpha^{(j+1)/2}} \exp \left( - \frac{4|x|}{c\sqrt{\beta}} \right), j = 0, 1, 2$ with some absolute constant $C_1 > 0$.

b) $|\tilde{T}_M \tilde{f}(t + is)| \leq \frac{\exp \left\{ \left( \frac{c^2}{2} \beta + \frac{10}{M^2} \right) s^2 \right\}}{1 + \left( \frac{c^2}{2} \alpha + \frac{10^{-11}}{9M^2} \right) t^2}$

for $|s| < \frac{4}{c\sqrt{\beta}}$.

**Proof of Lemma 8.** First we show that it follows from Proposition 2 that

$\left| \frac{d^j}{dx^j} [\phi_{n+1}(Q_{n,M}f)(x) - T_m \phi_n(f)(x)] \right| \leq \begin{cases} \leq C_1(C^4 + 1)c^{-n} \beta^{(j+1)/2} \exp \left( - \frac{2^{3/4}}{c\sqrt{\beta}} |2x| \right) & (6.3) \end{cases}$

If we replace $\phi_{n+1}(Q_{n,M}f)(x)$ by $\phi_{n+1}(x)Q_{n,M}f(x)$ in (6.3) then this modified version of relation (6.3) holds. Indeed, this follows from (3.18) for $|x| < 100c^{n/2}(\phi_{n+1}(x) = 1$ for $|x| < 100c^{n/2}$ and from the bounds given

on $Q_{n,M}(f)(x)$ and $T_M \phi_n(f)(x)$ in (3.16) and (3.17) for $|x| > 100c^{n/2}$.
(Observe that the support of $\phi_{n+1}(x)Q_{n,M}f(x)$ is in the set $|x| < 200c^{n/2}$.) Since
\[
\left| \int \phi_{n+1}(x)Q_{n,M}f(x)dx - 1 \right| = \int [1 - \phi_{n+1}(x)]Q_{n,M}f(x)dx \leq \frac{C^2}{\sqrt{\beta}} \exp \left( - \frac{c^{n/2}}{\sqrt{\beta}} \right) \leq C^2 c^{-n}
\]
and
\[
\left| \int x\phi_{n+1}(x)Q_{n,M}f(x)dx \right| = \left| \int x(\phi_{n+1}(x) - 1)Q_{n,M}f(x)dx \right| \leq C^2 c^{-n} \sqrt{\beta},
\]
simple calculation shows that (6.3) also holds in his original form. Since
\[
\tilde{\phi}_{n+1}(Q_{n,M}f)(0) - \tilde{T}_M \tilde{\phi}_n(f)(0) = \frac{d}{dt} \left[ \tilde{\phi}_{n+1}(Q_{n,M}f)(t) - \tilde{T}_M \tilde{\phi}_n(f)(t) \right] |_{t=0} = 0,
\]
we have for $|s| \leq \frac{\sqrt{2}}{c} \frac{2}{\sqrt{\beta}} \frac{c^{6/2}}{\sqrt{2}}$
\[
| \tilde{\phi}_{n+1}(Q_{n,M}f)(t + is) - \tilde{T}_M \tilde{\phi}_n(f)(t + is) | \leq 2(t^2 + s^2) \sup_{|\text{Im} \xi| < \frac{\sqrt{2}}{c} \frac{2}{\sqrt{\beta}} \frac{c^{6/2}}{\sqrt{2}}} \left| \frac{d^2}{d\xi^2} [\tilde{\phi}_{n+1}(Q_{n,M}f)(\xi) - \tilde{T}_M \tilde{\phi}_n(f)(\xi)] \right| \leq 2(t^2 + s^2) \int \exp \left( \frac{\sqrt{2}}{c} \frac{2}{\sqrt{\beta}} \frac{c^{6/2}}{\sqrt{2}} |x| \right) x^2 |\phi_{n+1}(Q_{n,M}f)(x) - T_M \phi_n(f)(x)| dx.
\]
(6.4)

Relation (6.1) follows from (6.3) (with $j = 0$) and (6.4). To prove (6.2) we integrate by parts the Fourier transform formula twice. We get that
\[
\tilde{\phi}_{n+1}(Q_{n,M}f)(t + is) - \tilde{T}_M \tilde{\phi}_n(f)(t + is) = -\frac{1}{\sqrt{2\pi(t + is)^2}} \int \exp \left[ (it-s)x \right] \frac{d^2}{dx^2} (\phi_{n+1}(Q_{n,M}f)(x) - T_M \phi_n(f)(x)) dx.
\]
Hence relation (6.3) (with $j = 2$) yields that
\[
| \tilde{\phi}_{n+1}(Q_{n,M}f)(t + is) - \tilde{T}_M \tilde{\phi}_n(f)(t + is) | \leq \frac{C}{t^2 \beta^{3/2}} c^{-n} \int \exp \left( |sx| - \frac{2^{3/4}}{c \sqrt{\beta}} |2x| \right) dx \leq \frac{C}{\beta t^2} c^{-n} \text{ for } |s| < \frac{\sqrt{2}}{c \sqrt{\beta}} \frac{c^{6/2}}{\sqrt{2}}.
\]
Similarly, integration by parts four times and relation (3.17) yield that
\[ |\tilde{T}_M \phi_n(f)(t + is)| \leq \frac{1}{t^4} \int \exp(|sx|) \left| \frac{d^4}{dx^4} T_M \phi_n(f)(x) \right| dx \leq \frac{C_1 C^2}{\beta^2 t^4} \quad \text{for} \quad |x| < \frac{2 \sqrt{2}}{c \sqrt{\beta}} \frac{s}{\sqrt{2}}. \]

Lemma 8 is proved.

**Proof of Lemma 9.** — First we estimate \( \tilde{T}_M \tilde{f} \). For \(|s| < \frac{1}{c \sqrt{\beta}}\), we have by (2.20)
\[
|\tilde{T}_M \tilde{f}(t + is)| = \left| \tilde{f} \left( \frac{c}{2} (t + is) \right) \right|^2 \exp \left( -\frac{c}{4M} s \right) \leq \exp \left( \frac{c^2}{2} \beta s^2 - \frac{c}{4M} s \right)
\]
\[
= \exp \left( \frac{c^2}{2} \beta s^2 \right) \exp \left( -\frac{c}{4M} s \right) \leq \left( \frac{1 + \frac{c^2}{4} \alpha t^2}{4M} \right)^2 \sqrt{1 - \frac{c}{2M} s} \exp \left( \frac{c^2}{2} \beta s^2 \right) \exp \left( -\frac{c}{4M} s \right)
\]
\[
= \left( \frac{1 + \frac{c^2}{4} \alpha t^2}{4M} \right)^2 \sqrt{1 - \frac{c}{2M} s} \exp \left( \frac{c^2}{2} \beta s^2 \right) \exp \left( -\frac{c}{4M} s \right)
\]
\[
\leq \exp \left\{ -\frac{1}{2} \left[ \frac{c}{2M} s - \log \left( 1 - \frac{c}{2M} s \right) \right] \right\} \leq \exp \left( \frac{10}{M^2} s^2 \right).
\]

Since for \(|s| < \frac{4}{c \sqrt{\beta}}\) and \(\beta > \frac{9}{M^2}, 1 - \frac{c}{2M} s < \frac{5}{3}\) and
\[
\exp \left( -\frac{c}{4M} s \right) = \exp \left\{ -\frac{1}{2} \left[ \frac{c}{2M} s - \log \left( 1 - \frac{c}{2M} s \right) \right] \right\} \leq \exp \left( \frac{10}{M^2} s^2 \right).
\]

we get from (6.5) that under the conditions of Lemma 9
\[
|\tilde{T}_M \tilde{f}(t + is)| \leq \exp \left\{ \left( \frac{c^2}{2} \beta + \frac{10}{M^2} s^2 \right) \right\} \leq \left( 1 + \frac{9 c^2 t^2}{100 M^2} \right) \exp \left( \frac{10}{M^2} s^2 \right) \quad \text{for} \quad |s| < \frac{4}{c \sqrt{\beta}}. \quad (6.6)
\]

We estimate \( \frac{d^j}{dx^j} T_M f(x) \) by applying inverse Fourier transformation and
integrating \( \frac{4}{c\sqrt{\beta}} i + t \). We get from (6.6) for \( j = 0, 1, 2 \) that
\[
\frac{d^j}{dx^j} T_Mf(x) = \frac{1}{2\pi} \int \left( t + \frac{4\text{sign } x}{c\sqrt{\beta}} i \right)^j \exp \left[ -ix \left( t - \frac{4\text{sign } x}{c\sqrt{\beta}} i \right) \right] \tilde{T}_Mf \left( t + \frac{4\text{sign } x}{c\sqrt{\beta}} i \right) dt
\]
and
\[
\left| \frac{d^j}{dx^j} T_Mf(x) \right| \leq \frac{1}{2\pi} \exp \left\{ -\frac{4|x|}{c\sqrt{\beta}} + \left( 8 + \frac{160}{c^2\beta M^2} \right) \right\} \int \left[ \left| t \right|^j + \left( \frac{4}{c\sqrt{\beta}} \right) \right] \frac{dt}{\left( 1 + \frac{c^2}{4} \alpha t^2 \right)^2} \leq C_1 \exp \left( -\frac{4|x|}{c\sqrt{\beta}} \right) \alpha^{-(j+1)/2} \int \left( \left| t \right|^2 + \left( \frac{\alpha}{\beta} \right)^{j/2} \right) \frac{1}{(1 + t^2)^2} dt \leq \pi C_1 \alpha^{-(j+1)/2} \exp \left( -\frac{4|x|}{c\sqrt{\beta}} \right),
\]
since \( \alpha/\beta \leq 1 \). Part a) is proved.

We claim that
\[
\left( 1 + \frac{c^2}{2} \alpha t^2 \right)^4 \sqrt{1 + \frac{9c^2}{100 M^2} t^2} - 1 \geq \frac{1}{9} \frac{t^2}{M^2} \frac{1}{1 + \frac{c^2}{2} \alpha t^2} \text{ if } \alpha > \frac{10^{-12}}{M^2}. \tag{6.7}
\]
Relations (6.6) and (6.7) imply part b) of Lemma 9.

Relation (6.7) is equivalent to
\[
\sqrt{1 + \frac{9c^2}{100 M^2} t^2} - 1 \geq \frac{10^{-11}}{9} \frac{t^2}{M^2} \frac{1}{1 + \frac{c^2}{2} \alpha t^2} \text{ if } \alpha > \frac{10^{-12}}{M^2}. \tag{6.7}'
\]

Since \( \sqrt{x + 1} - 1 \geq \frac{x}{4} (1 + x)^{-3/4} \) for \( x > 0 \) the left hand side of (6.7)' can be estimated as
\[
\sqrt{1 + \frac{9c^2}{100 M^2} t^2} - 1 \geq \frac{9c^2}{400 M^2} \left( 1 + \frac{9c^2}{100 M^2} t^2 \right)^{-3/4}. \tag{6.8}
\]
Observe that \( (1 + x)^{3/4} < 1 + x^{3/4} \) for \( x > 0 \), since for \( f(x) = (1 + x)^{3/4} - x^{3/4} - 1 \).
\( f(0) = 0, \text{ and } f'(x) \leq 0 \text{ for } x > 0. \) This estimate together with (6.8) imply that the left hand side of (6.7)' can be estimated as

\[
\frac{4}{\sqrt{1 + \frac{9c^2}{100 M^2}} - 1} \geq \frac{9c^2}{400 M^2} \frac{1}{1 + \left(\frac{9c^2}{100 M^2}\right)^{3/4}}
\]

and since \( \alpha > 10^{-12} \frac{1}{M^2} \), relation (6.7)' follows from the inequality

\[
1 + \left(\frac{9c^2}{100 M^2}\right)^{3/4} \leq \frac{81 \cdot 10^{11}}{400} c^2 \left(1 + \frac{c^2}{2} \frac{10^{-12} t^2}{M^2}\right),
\]

or equivalently

\[
\left(\frac{9c^2}{100 M^2}\right)^{3/4} \leq \left(\frac{81}{400} \cdot 10^{12} c^2 - 1\right) + \frac{81 c^4}{8000 M^2}.
\]

The last relation follows from the inequality \( a + b \geq 4.3^{-1/4} a^{3/4} b^{1/4} \) with the choice \( a = \frac{81 t^2}{8000 M^2} \) and \( b = \frac{81}{4000} 10^{12} c^2 - 1 \). Lemma 9 is proved.

**Proof of Proposition 3.** — First we show some properties of the numbers \( \alpha_n, \beta_n \) defined in (3.8), (3.8)', (3.9), (3.9)'. We claim that

\[
\beta_n > \alpha_n > \frac{1}{2} 10^{-13} \beta_n
\]

if the starting index \( N \) in the definition of \( \alpha_n \) and \( \beta_n \) is larger than some \( N_0(c) \).

Indeed, let \( N \) be so large that \( \prod_{j=N}^{\infty} \frac{1 + c^{j/2}}{1 - c^{j/2}} < 2. \)

Since \( \min \left(\frac{\beta_{n+1}}{\alpha_n}, 1\right) \leq \frac{\beta_{n+1}}{\alpha_{n+1}} \leq \max \left(1 + \frac{c^{n/2}}{1 - c^{n/2}}, \frac{\beta_n}{\alpha_n}, 10^{13}\right) \) simple induction yields that \( \beta_n > \alpha_n > \prod_{j=N}^{n-1} \left(\frac{1 - c^{j/2}}{1 + c^{j/2}}\right) 10^{-13} \beta_n \) for all \( n \geq N \). This implies (6.9). Under the conditions of Proposition 3

\[
\beta_n > \frac{5}{\sqrt{M_n}}, \quad \beta_n < 1, \quad \frac{1}{\sqrt{\beta_{n+1}}} < \frac{\sqrt{2}}{c} \frac{1}{\sqrt{\beta_n}}, \quad \text{and} \quad \beta_{n+1} < 3 \beta_n. \quad (6.10)
\]

The last relation follows from the following estimates: \( \beta_n > \frac{10}{M_{n-1}^2} > \frac{5}{M_n^2} \) and \( \beta_{n+1} \leq \beta_n + \frac{10}{M_n^2} \), hence \( \beta_{n+1} \leq 3 \beta_n \). Similarly

\[
\alpha_{n+1} < 3 \alpha_n. \quad (6.10)'
\]
Now we prove that Properties I(n), J(n) and the additional conditions on M\(_n\), \(\beta_n\) and \(n\) in Proposition 3 imply Properties I(n+1) and J(n+1). In the proof we shall apply Proposition 2 and Lemma 8 with \(f(x) = f_n(x)\), \(M = M_n\), \(\beta = \beta_n\) and \(\epsilon = 1 - 2^{-1/4}\) and Lemma 9 with \(f(x) = \phi_n(f_n(x))\), \(\beta = \beta_n\), \(\alpha = \alpha_n\) and \(M = M_n\). Observe that \(M = M_{n+1}\) in Proposition 2 with this choice. First we prove I(n+1).

If \(|x| > C_2\sqrt{\beta_n}\log C, x > -c^{n+1}M_{n+1}\), where \(C_2 > 0\) will be appropriately chosen then by (3.16)

\[
\left| \frac{d^j}{dx^j} f_{n+1}(x) \right| \leq C_1 C^2 \beta_n^{-(j+1)/2} \exp \left( - \frac{2^{3/4}}{2\sqrt{\beta_n}} \left| \frac{x^2}{c^{n+1}M_{n+1}} + 2x \right| \right) \leq C \beta_n^{-(j+1)/2} \exp \left( - \frac{1}{\sqrt{\beta_n}} \left| \frac{x^2}{c^{n+1}M_{n+1}} + 2x \right| \right)
\]

for \(j = 0, 1, 2, x > -c^{n+1}M_{n+1}\),

since

\[
\exp \left[ \left( - \frac{2^{3/4}}{c\sqrt{\beta_n}} + \frac{1}{\sqrt{\beta_n}} \right) \left| 2x + \frac{x^2}{c^{n+1}M_{n+1}} \right| \right] \leq \exp \left( - \frac{1}{10\sqrt{\beta_n}} \left| 2x + \frac{x^2}{c^{n+1}M_{n+1}} \right| \right) < \frac{1}{CC_1}
\]

if \(x > -c^{n+1}M_{n+1}\) and \(|x| > C_2\sqrt{\beta_n}\log C\) with a sufficiently large absolute constant \(C_2\).

If \(|x| < C_2\sqrt{\beta_n}\log C\) and \(n > n(C, c)\) part a) of Lemma 9 and (3.18) imply that

\[
\left| \frac{d^j}{dx^j} f_{n+1}(x) \right| \leq \left| \frac{d^j}{dx^j} T_{M_n} \phi_n(f_n(x)) \right| + \left| \frac{d^j}{dx^j} [Q_{n,M_n} f_n(x) - T_{M_n} \phi_n(f_n(x))] \right| \leq C_1 \beta_n^{-(j+1)/2} \exp \left( - \frac{4 |x|}{c\sqrt{\beta_n}} \right) + c^{-n}C_1 \beta_n^{-(j+1)/2} \exp \left( - \frac{2^{3/4}}{\sqrt{\beta_n}} \left| \frac{x^2}{c^{n+1}M_{n+1}} \right| \right) + \exp \left( - \frac{2^{3/4}}{\sqrt{\beta_n}} |x| \right).
\]

(6.11)

If \(n\) is so large that \(c^{-n}C_1 \beta_n < \frac{C}{8}\) and for

\[
|x| < C_2\sqrt{\beta_n}\log C \frac{1}{\sqrt{\beta_n}} \frac{x^2}{c^{n+1}M_{n+1}} < \frac{1}{c^{n+1}} C_2^2 (\log C)^2 < 1/2
\]
LARGE-SCALE LIMIT OF DYSON’S HIERARCHICAL VECTOR-VALUED MODEL. — PART I

\[
\left(\text{this allows to replace } - \frac{4|x|}{c\sqrt{\beta_n}} \text{ and } - \frac{2.23^{3/4}}{c\sqrt{\beta_n}} \right) \text{ by}
\]

\[
- \frac{1}{\sqrt{\beta_{n+1}}} \left| 2x + \frac{x^2}{c^{n+1}M_{n+1}} \right| + 1
\]

at the right hand side of (6.11) then (6.11) implies that

\[
\left| \frac{d^j}{dx^j} f_{n+1}(x) \right|
\]

\[
\leq \left( 3C_1\alpha_n^{(j+1)/2} + \frac{C}{2} \beta_n^{-(j+1)/2} \right) \exp \left( - \frac{1}{\sqrt{\beta_{n+1}}} \left| 2x + \frac{x^2}{c^{n+1}M_{n+1}} \right| \right) \tag{6.12}
\]

for \( j = 0, 1, 2, |x| < C_2\sqrt{\beta_n \log C} \). If \( C \) is so large that \( 3C_1\alpha_n^{(j+1)/2} < \frac{1}{2} \beta_n^{-(j+1)/2} \), then relation (6.12) implies \( I(n+1) \) for \( |x| < C_2\sqrt{\beta_n \log C} \). Such a choice of \( C \) is possible since \( C_1 \) is an absolute constant, and relation (6.9) holds.

Now we prove \( J(n+1) \). First we consider the case \( |t| > \frac{C_3C}{\sqrt{\beta_n}} \) with a sufficiently large absolute constant \( C_3 \). Since

\[
\frac{2}{\sqrt{\beta_{n+1}}} < \frac{\sqrt{2}}{c} \frac{2}{\sqrt{\beta_n}} \frac{s/2}{c\sqrt{\beta_n}} < \frac{4}{2\sqrt{\beta_{n+1}}}
\]

we can apply Lemmas 8 and 9 for \( |s| < \frac{1}{\sqrt{\beta_{n+1}}} \). Part \( b \) and formula (6.2) from Part \( a \) of Lemma 8 imply that

\[
|\tilde{\phi}_{n+1}(f_{n+1})(t + is)| \leq \frac{C_1C^2}{\beta_n^2t^4} + \frac{C_1C^2}{\beta_n^2t^4} c^{-n} \leq \frac{10^{-14}}{\beta_n^2t^2}
\]

if \( n \) is so large that \( C_1C^2c^{-n} < \frac{1}{2} 10^{-14} \), and \( C_3 \) is so large that

\[
\frac{C_1C^2}{\beta_n^2t^2} < \frac{C_1}{C_3} < \frac{1}{2} 10^{-14}.
\]

Let \( C_3 \) be so large that also the relation \( \alpha_n t^2 > \frac{1}{2.10^{13}} C_3^2C^2 > \frac{1}{2.10^{13}} C_3 > 1 \) holds for \( |t| > C_3\beta_n^{-1/2} \). (We may assume that \( C > 1 \).) Then

\[
|\tilde{\phi}_n(f_n)(t + is)| \leq \frac{1}{5\alpha_n^2t^2} \leq \frac{1}{1 + 4\alpha_n^2t^2} \leq \frac{\exp \beta_{n+1}s^2}{1 + \alpha_{n+1}t^2}.
\]

For $|t| < \frac{C_3 C}{\sqrt{\beta_n}}, |s| < \frac{2}{\sqrt{\beta_{n+1}}}, n > n(c, C)$ Part b) of Lemma 9 and (6.1) imply that

$$|\tilde{\phi}_{n+1}(f_{n+1})(t + is)| \leq \frac{\exp \left[ \left( \frac{c^2}{2} \beta_n + \frac{10}{M_n^2} \right) s^2 \right]}{1 + \left( \frac{c^2}{2} \alpha_n + \frac{1}{9} \frac{10^{-11}}{M_n^2} \right) t^2} + C_1 C^n c^{-n(s^2 + t^2)} \beta_n. \quad (6.12)'$$

For $|t| < \frac{CC_3}{\sqrt{\beta_n}}, n > n(c, C)$ $1 + \left( \frac{c^2}{2} \alpha_n + \frac{1}{9M_n^2} \right) 10^{-11} t^2 \leq 2C_3^2 C^2,$

$$1 + \left( \frac{c^2}{2} \alpha_n + \frac{1}{9M_n^2} \right) 10^{-11} t^2 - \frac{c^2}{2} \alpha_n e^{-n/2} t^2 > 0,$$

hence

$$\frac{\exp \left\{ \left( \frac{c^2}{2} \beta_n + \frac{10}{M_n^2} \right) s^2 \right\}}{1 + \left( \frac{c^2}{2} \alpha_n + \frac{1}{9M_n^2} \right) 10^{-11} t^2 - \frac{c^2}{2} \alpha_n e^{-n/2} t^2} \leq \frac{\alpha_n c^{-n/2} t^2}{10C_3^2 C^4} \quad (6.13)$$

and

$$\frac{\exp \left\{ \left( \frac{c^2}{2} \beta_n + \frac{10}{M_n^2} \right) s^2 + \frac{c^2}{2} \beta_n e^{-n/2} s^2 \right\}}{1 + \alpha_{n+1} t^2} \geq \frac{\exp \left\{ \left( \frac{c^2}{2} \beta_n + \frac{10}{M_n^2} \right) s^2 \right\}}{1 + \alpha_{n+1} t^2} \geq \frac{\beta_n e^{-n/2} s^2}{10C_3^2 C^4}. \quad (6.13)'$$

Relations (6.13) and (6.13)' imply that

$$\exp \left[ \left( \frac{c^2}{2} \beta_n + \frac{10}{M_n^2} \right) s^2 \right] \geq \frac{1}{10C_3^2 C^4} c^{-n/2} \beta_n (s^2 + t^2) \quad (6.14)$$

Relations (6.12)' and (6.14) imply $J(n + 1)$ if $n > n(c, C)$. Relations (3.12), (3.13) and (3.14) are straightforward consequences of Proposition 2. Let us choose some $C > 0$ and $N_0 = N_0(c, C)$ in such a way that for $n \geq N_0$
and this C all conditions imposed on them during the proof of Properties I(n + 1) and J(n + 1) be satisfied. Let us choose some N ≥ N₀ and koń(N) in such a way that Proposition 1 holds for n ≤ N if końⁿ > koń(N) and 0 < T < 1/10. Moreover, let koń₀ be so large that |Mᴺ - Mᴺ⁻¹| < 1, Mᴺ > K(c) + ∑ᵢ₌₁ⁿ⁺¹ c⁻ᵢ, where K(c) is the same number which appears in the formulation of Proposition 3, and βₙ = (c²N)/2 > max(9/ₘᴺ², 4⁻ᴺ). Such a choice of koń₀ is possible because of relation (3.4). Properties I(N) and J(N) (with the above constants C and N) hold if we choose okino in the above way, and in this case Mᴺ > K(c), |Mᴺ - Mᴺ⁻¹| < 1, 100 > βₙ > max(9/ₘᴺ², 4⁻ᴺ). Then, because of the above proof of I(n + 1) and J(n + 1) from I(n) and J(n) and relation (3.12), a simple induction yields that Properties I(n) and J(n) (with the parameters C and N) hold for all n ≥ N, and also the relations

\[ |Mⁿ⁺¹ - Mⁿ| < c⁻ⁿ ≤ 1 \quad Mⁿ⁺¹ > K(n + 1) > K(c) \quad K(n) = ∑ᵢ₌₀ⁿ⁻¹ c⁻ᵢ + K(c), \]

\[ βⁿ⁺¹ > max\left(\frac{9}{ₘⁿ²}, 4^{-n+1}\right) \]

are valid. Proposition 3 is proved.

The following two lemmas are consequences of Proposition 3.

**Lemma 10.** — If  końⁿ = \( \frac{a₁(a₀ - T)Tn²}{2} > K, 0 < T < \frac{1}{10} \), with some K then the limit \( \lim \limits_{n→∞} Mⁿ = M \) exists and |koń₀ - M| < 1. For all ε > 0 there is some K(ε) > 0 such that if koń₀ > K(ε) then |Mⁿ - koń₀| < ε. Also the relations

\[ Mⁿ = M + \frac{c}{4(c - 1)M} cⁿ - δ(n) \cdot c⁻ⁿ, \quad |δ(n)| ≤ koń(c)c⁻ⁿ \]

and

\[ βⁿ < \frac{1}{ₘⁿ^² \mu^²} \quad \text{with} \quad \mu = \frac{1}{6} \left(1 - \frac{c²}{2}\right)^{1/2} \quad \text{if} \quad n > n₀(koń₀, c) \]

hold with some appropriate koń(c) and n₀(koń₀, c).

(Here in the definition of βₙ we fix some starting index N for which

\[ βₙ = \left(\frac{c²}{2}\right)^{N} \]

LEMMA 11. — Under the conditions of Theorem 1 there is some

\[ n_0 = n_0(M_0, c) \]

such that for \( n > n_0 \)

\[ \left| \frac{d^j}{dx^j} f_n(x) \right| < CM^{j+1} \exp\left( -\frac{\mu M}{2} |x| \right) \]

if \( x > -c^n M_n, \quad j = 0, 1, 2 \) \hspace{1cm} (6.17)

\[ |\phi_{n+1}(f_{n+1})(x) - T_M \phi_n(f_n)(x)| \leq c^{-n} CM \exp\left( -\frac{\mu M}{2} |x| \right) \]

for all \( x \in \mathbb{R}^1 \) \hspace{1cm} (6.18)

where \( C \) is some absolute constant, and \( \mu \) is the same as in Lemma 10.

Proof of Lemma 10. — It follows from (3.12) that \( \lim M_n = M \) exists, and if we choose properly the starting index \( N \) in Proposition 3 and also \( M_0 \) is sufficiently large then \( |M_N - \bar{M}_0| < \varepsilon \) and \( |M_N - M| < \varepsilon/2 \). Since \( M > K \) for all \( n \)

\[ |M_n - M| \leq \sum_{j=n}^{\infty} |M_n - M_{n-1}| < Kc^{-n}. \]

Substituting this relation into (3.12) we get that

\[ M_{n+1} - M_n = -\frac{1}{4c^n M} + r(n) \]

with \( |r(n)| < Kc^{-n} \).

Summing up this relation for all \( j > n \) we get (6.15). To prove (6.16) let us introduce the auxiliary sequence \( \bar{\beta}_n \)

\[ \bar{\beta}_n = 100, \quad \bar{\beta}_n = \frac{1}{2} \left( \frac{c^2}{2} + 1 \right) \bar{\beta} + \frac{15}{M_2}. \]

Then \( \bar{\beta}_n > \beta_n \) for all \( n \geq N \). On the other hand if \( \bar{\beta} \) is the solution of the fixed point equation \( \bar{\beta} = \frac{1}{2} \left( \frac{c^2}{2} + 1 \right) \bar{\beta} + \frac{15}{M_2} \) then \( \beta_n \to \bar{\beta} = \frac{30}{M_2} \left( 1 - \frac{c^2}{2} \right)^{-1/2} \).

Hence for \( n > n_0(M_0, c) \)

\[ \beta_n < \bar{\beta}_n < \frac{6}{5} \beta, \quad \text{i.e. relation (6.16) holds.} \]

Proof of Lemma 11. — Relation (6.17) immediately follows from (3.10), (6.15) and the inequality \( \beta_n > \frac{10}{M_n^2} > \frac{9}{M^2}. \)

We claim that

\[ |T_M \phi_n(f_n)(x) - T_{M_n} \phi_n(f_n)(x)| \leq c^{-n} CM \exp\left( -\frac{\mu M}{2} |x| \right) \]

and

\[ |\phi_{n+1}(f_{n+1})(x) - \phi_{n+1}(f_{n+1})(x)| \leq c^{-n} CM \exp\left( -\frac{\mu M}{2} |x| \right), \]

for all \( x \).

Relation (6.18) follows from (6.19), (6.20), (6.16), the inequality \( \beta > \frac{9}{M^2} \)

and relation (3.18) for \( |x| < 100c^{n/2} \) and relations (3.16), (3.17) for \( |x| > 100c^{n/2} \).
For $|x| > 50c^{n/2}$ relations (6.19) and (6.20) follow from the bounds given on the terms $T_M\phi_n f_n(x), T_M\phi_n (f_n(x), \phi_{n+1}(f_{n+1}(x))$ and $\phi_{n+1}(x)^{-1} f_{n+1}(x)$ in Proposition 3, Lemmas 6 and 10.

To prove (6.19) for $|x| < 50c^{n/2}$ observe that $T_Mf_n(x) = T_Mg_n \left( \frac{M}{M} x \right)$ with $g_n(x) = \frac{M}{M} f_n \left( \frac{M}{M} x \right)$, and $\left| \frac{M}{M} - 1 \right| \leq \frac{2}{M^2} c^{-n}$. Since

$$|g_n(x) - f_n(x)| \leq \left| \frac{M}{M} - 1 \right| \left| f_n \left( \frac{M}{M} x \right) - f_n(x) \right|$$

and

$$\left| T_Mg_n \left( \frac{M}{M} x \right) - T_Mg_n(x) \right| \leq \left| \frac{M}{M} - 1 \right| \left| x \right| \sup_{x < y < \frac{M}{M} x} \left| d \frac{d}{dx} T_Mg_n(y) \right|$$

relation (6.19) can be proved with the help of Lemma 6.

To prove (6.20) observe that

$$\left| A_{n+1} - 1 \right| = \left| \int_{-c^{n+1}M_{n+1}}^{c^{n+1}M_{n+1}} [1 - \phi_{n+1}(x)] \cdot f_{n+1}(x)dx \right| \leq c^{-n} \quad (7.1)$$

and

$$B_{n+1} = \frac{1}{A_{n+1}} \int_{-c^{n+1}M_{n+1}}^{c^{n+1}M_{n+1}} x\phi_{n+1}(x)f_{n+1}(x)dx \leq \frac{c^{-n}}{M_{n+1}}.$$

Then we get relation (6.20) by estimating the expressions

$$f_{n+1}(x + B_{n+1}) - f_{n+1}(x) \quad \text{and} \quad (A_{n+1} - 1)f_{n+1}(x)$$

with the help of Proposition 3 and Lemma 10.

Let us finally remark that in the same way as we deduced relation (6.17) we get that

$$\left| \frac{d^j}{dx^j} \phi_n(f_n(x)) \right| \leq CM^{j+1} \exp \left( -\frac{\mu M}{2} |x| \right), \quad j = 0, 1, 2, \quad x \in \mathbb{R}^1 \quad (6.21)$$

7. ON THE FIXED POINT EQUATION $T_Mg = g$

By formulas (2.16) and (2.17) the operator $T_Mg$ can be written in the form

$$T_Mg(x) = \frac{2}{c \sqrt{\pi}} \int e^{-x^2} g \left( \frac{x}{c} \right) \frac{1}{4M} + \frac{v^2}{2M} g \left( \frac{x}{c} - \frac{1}{4M} - u - \frac{v^2}{2M} \right) du dv, \quad g \in \mathcal{A}$$

where the class of functions $\mathcal{A}$ is defined in (2.19). We prove the following.
LEMA 12. The fixed point equation $T_M g = g$ has a unique solution in the class $\mathcal{A}$ beside the trivial one $g(x) \equiv 0$. It can be written in the form $g_M(x) = Mg_1(Mx)$, where $g_1(x)$ is the solution of the equation $T_1 g_1 = g_1$. The function $g_1(x)$ is the density function of the random variable

$$
\zeta = \frac{1}{2} \sum_{k=0}^{\infty} \sum_{j=1}^{2^k} \left( \frac{c}{2} \right)^{k+1} (1 - \eta_{j,k}^2), \quad (7.2)
$$

where $\eta_{j,k}, k = 0, 1, 2, \ldots, j = 1, 2, \ldots, 2^k$ are independent standard normal random variables. The solution of the equation (1.6) is $g_1(x - \frac{c}{4(c-1)})$.

Remark. In the case of $p$ dimensional models, $p \geq 2$, $g_1(x)$ is the density function of the random variable

where $\eta_{j,k,i}$ are independent standard normal variables.

Proof of Lemma 12. Relation (2.20)' tells us that

$$
\tilde{T}_M g_M(\xi) = g_1 \frac{\exp \left( i\frac{c}{4M} \frac{\xi}{\xi} \right)}{\sqrt{1 + i\frac{c}{2M} \xi}} \quad \text{if} \quad g \in \mathcal{A} \quad (7.3)
$$

and this relation also holds if $\xi = t + is, |s| < s(f)$. If $T_M g_M = g_M$ then relation (7.3) with $\xi = 0$ implies that $\tilde{g}_M(0) = \tilde{g}_M(0)^2$, hence either $\tilde{g}_M(0) = 1$ or $\tilde{g}_M(0) = 0$. If $\tilde{g}_M(0) = 0$ then successive differentiation of the equation

$$
\tilde{T}_M \tilde{g}_M(\xi) = \tilde{g}_M(\xi) \Rightarrow \frac{d^n}{dt^n} \tilde{g}_M(t) \bigg|_{t=0} = 0 \text{ for all } n = 0, 1, 2, \ldots,
$$

therefore $\tilde{g}_M(\xi) \equiv 0$, i.e. in this case we get the trivial solution $g_M(x) \equiv 0$.

Iterating the equation (7.3) we get that

$$
\tilde{T}_M^{k} \tilde{g}(\xi) = \tilde{g} \left( \left( \frac{c}{2} \right)^{k} \xi \right) \prod_{j=1}^{k} \exp \left[ \frac{(i/2M)(c/2)^j}{\left( 1 + i\frac{c}{2M} \frac{\xi}{\xi} \right)^{j/2}} \right] \quad \text{for all } k \geq 1. \quad (7.4)
$$

If $g_M = T_M g_M, g_M \in \mathcal{A}$, and $\tilde{g}_M(0) = 1$ then we get differentiating (7.3) that $\tilde{g}_M(0) = c \tilde{g}_M(0)$, hence $\tilde{g}_M(0) = 0$. On the other hand

$$
|\tilde{g}_M(\xi)| \leq \int x^2 e^{sx} |g_M(x)| \, dx \leq A < \infty
$$

Annales de l’Institut Henri Poincaré - Physique théorique
with some appropriate $A > 0$ (which may depend on $g_M$) if
\[ |\text{Im } \xi| = |s| < \frac{s(g_M)}{2}. \]

Hence \( \exp \left( -A|\xi|^2 \right) \leq \tilde{g}_M(\xi) \leq \exp \left( A\xi^2 \right) \) if $|\xi| < \varepsilon$, and $\tilde{g}_M \left( \left( \frac{c}{2} \right)^k \xi \right)^{2^k} \to 1$ if $k \to \infty$ for arbitrary $\xi$. (Observe that $\frac{c^2}{2} < 1$.) Since $\tilde{g}_M(\xi) = \lim_{k \to \infty} \tilde{T}_M^k \tilde{g}_M(\xi)$, the above relation together with (7.4) imply that $\tilde{g}_M$ must be of the form
\[ \tilde{g}_M(\xi) = \prod_{j=1}^{\infty} \exp \left[ \frac{(i/2M)(c/2)^j}{1 + i \frac{c}{M}(c/2)^j} \xi \right]^{2^{j-1}}. \]  

(7.5)

Since
\[ \frac{\exp \left( i \frac{1}{2M} \left( \frac{c}{2} \right)^j \xi \right)}{\sqrt{1 + i \frac{c}{M} \left( \frac{c}{2} \right)^j \xi}} \]
is the characteristic function of the random variable
\[ \frac{1}{2M} \left( \frac{c}{2} \right)^j (1 - \eta^2), \]
where $\eta$ is a standard normal random variable, hence the function $\tilde{g}_M$ is the characteristic function of the random variable $\frac{1}{M} \xi$, where $\xi$ is defined in (7.2). If $g_M(x)$ denotes the density function of the random variable $\frac{1}{M} \xi$ then $g_M \in \mathcal{A}$, and its Fourier transform is given in (7.5). Since this function $\tilde{g}_M$ satisfies the relation $\tilde{g}_M = \tilde{T}_M \tilde{g}_M$, as a simple calculation shows with the help of (7.3), the function $g_M$ is the solution of the fixed point equation $g = T_Mg$. The rest of Lemma 12 follows from simple calculation.

In the next lemma we prove the properties of the function $g_M$ important for us.

**Lemma 13.** — For any $1 > \varepsilon > 0$ the function $g_1(x)$ defined in Lemma 12 satisfies the relations

a) \[ |\tilde{g}_1(t + is)| \leq \frac{C_j(\varepsilon)}{1 + tj} \text{ for } |s| < (1 - \varepsilon) \frac{2}{c} \text{ and arbitrary } t, j = 1, 2, \ldots \]

b 1) \[ \left| \frac{d^j}{dx^j} g_1(x) \right| \leq C_j(\varepsilon) \exp \left[ -(1 - \varepsilon) \frac{2}{c} |x| \right] \text{ for arbitrary } x \text{ and } j = 0, 1, \ldots \]

b 2) \[ \left| \frac{d^j}{dx^j} g_1(x) \right| \leq C_j \exp \left( -Ax^2 \right) \text{ with } x = \frac{\log 2}{\log c} \text{ for } x > 0, j = 0, 1, \ldots \]
with some appropriate positive constants $C_j(c), C_j$ and $A$ which may depend on the parameter $c$.

Proof of Lemma 13. — Proof of Part a). Relation (7.5) with $M = 1$ implies that

$$
|g_1(t + is)| = \exp \left\{ - \sum_{k=1}^{\infty} 2^{k-2} \left( \left( \frac{c}{2} \right)^k s + \frac{1}{2} \log \left[ 1 - \left( \frac{c}{2} \right)^k \right] \right) \right\} = \\
= \exp \left\{ - \sum_{k=1}^{\infty} 2^{k-2} \left[ \left( \frac{c}{2} \right)^k s \log \left( 1 - \left( \frac{c}{2} \right)^k \right) \right] \right\} \\
= \exp \left\{ - \sum_{k=1}^{\infty} 2^{k-3} \log \left[ 1 + \left( \frac{c}{2} \right)^{2k} \right] \right\} = I_1(s) \cdot I_2(s, t).
$$

(7.6)

For $|s| < (1 - \varepsilon) \frac{2}{c} \left( \frac{c}{2} \right)^k s < 1 - \varepsilon$ for all $k = 1, 2, \ldots$, hence the relation $|x - \log(1 - x)| \leq \frac{x^2}{1 - |x|}$ for $|x| < 1$ implies that

$$
I_1(s) \leq \exp \left\{ - \frac{1}{4} \sum_{k=1}^{\infty} \frac{1}{4} \left( \frac{c}{2} \right)^{2k} s^2 \right\} < \exp \left( - \frac{1}{c(2 - c^2)} \right) \text{ if } |s| < \frac{2}{c} (1 - \varepsilon).
$$

(7.7)

On the other hand, since each term in the sum in the expression $I_2(s, t)$ is non-negative

$$
I_2(s, t) \leq 1
$$

(7.8)

and for any $k = 1, 2, \ldots$

$$
I_2(s, t) \leq \exp \left\{ - 2^{k-3} \log \left[ 1 + \left( \frac{c}{2} \right)^{2k} \right] \right\} \leq \\
\leq \exp \left\{ - 2^{k-3} \log \left[ t^2 \left( \frac{c}{2} \right)^{2k} \frac{1}{1 - \left( \frac{c}{2} \right)^k s^2} \right] \right\} \leq |t|^{-2k-2} A_k(s)
$$

(7.8')

with $A_k(s) = \left\{ \left( \frac{2}{c} \right)^{2k} \left[ 1 - \left( \frac{c}{2} \right)^k s^2 \right] \right\}^{2k-3}$.
Since $A_k(s) < A_k$ with some $A_k$ for $|s| < \frac{2}{c}(1 - \epsilon)$ relations (7.6), (7.7), (7.8) and (7.8)' imply Part a).

Since

$$\frac{d^j}{dx^j} g_1(x) = \frac{1}{2\pi} \int (-it + s)^j \exp \{ -it(t + is) \} \tilde{g}_1(t + is) dt$$

Part a) gives with the choice $s = -(1 - \epsilon) \frac{2}{c} \text{sign } x$ that

$$\left| \frac{d^j}{dx^j} g_1(x) \right| \leq \frac{1}{2\pi} C_{j+2}(\epsilon) \exp \left[ -(1 - \epsilon) \frac{2}{c} |x| \right] \int \left( |t| + \frac{2}{c} \right)^j \frac{1}{1 + |t|^{j+2}} dt \leq \left[ -(1 - \epsilon) \frac{2}{c} |x| \right].$$

To prove b) first we give a better estimate on $I_1(s)$ for $s < 0$. Take some integer $L > 0$ to be defined later. Since $x - \log(1 + x) < \frac{x^2}{2}$ and $x - \log(1 + x) < x$ we can write for $s < 0$

$$I_1(s) = \exp \left\{ \sum_{k=1}^{L} 2^{k-2} \left[ \left( \frac{c}{2} \right)^k |s| - \log \left( 1 + \left( \frac{c}{2} \right)^k |s| \right) \right] \right\}$$

$$\leq \exp \left\{ \sum_{k=L+1}^{\infty} 2^{k-2} \left[ \left( \frac{c}{2} \right)^k |s| - \log \left( 1 + \left( \frac{c}{2} \right)^k |s| \right) \right] \right\} \leq$$

$$\leq \exp \left\{ \frac{1}{4} \left[ \frac{c^{L+1} - c}{c - 1} |s| + \frac{1}{c^2} \left( \frac{c^2}{2} \right)^{L+1} s^2 \right] \right\} \leq$$

$$\leq \exp \left\{ \text{const.} \left\{ c^L |s| + \left( \frac{c^2}{2} \right)^L s^2 \right\} \right\}. \quad (7.9)$$

Choose $L$ in such a way that $\left( \frac{c}{2} \right)^L |s| \geq 1$ and $\left( \frac{c}{2} \right)^{L+1} |s| < 1$. (Let $L = 1$ if $\frac{c}{2} |s| < 1$.) Then relation (7.9) with this $L$ implies that $I_1(s) < \exp(A |s|^\beta)$ for $s < 0$ with some $A > 0$ and $\beta = \frac{\log 2}{\log 2 - \log c}$.

Relations (7.8), (7.8)' and the inequality $A_k(s) < A_k$ hold for all $s < 0$, hence $I_2(s, t) \leq \frac{C_k}{1 + |t|^k}$. The estimates given for $I_1$ and $I_2$ together with (7.6) yield that $|\tilde{g}(t + is)| \leq C(j) \frac{\exp(A |s|^\beta)}{1 + |t|^j}$ for $s < 0$ and arbitrary $j \geq 0$. 

Hence, by applying the inverse Fourier transformation, we get that for arbitrary \( s < 0 \)
\[
\left| \frac{d^j}{dx^j} \tilde{g}_1(x) \right| \leq \int \left( |t| + |s| \right)^j e^{sx} \left| \tilde{g}(t + is) \right| \, dt \leq C(j + 2) \exp (sx + A \, |s|^\alpha) \cdot \int \frac{\left( |t| + |s| \right)^j}{1 + |t|^{j+2}} \, dt. \quad (7.10)
\]

Given some \( x > 0 \) choose \( s = -\left( \frac{x}{\alpha A} \right) \). Then
\[
\exp (sx + A \, |s|^\alpha) = \exp \left\{ - \left( 1 - \frac{1}{\alpha A} \right) \frac{1}{\alpha - 1} x^{\frac{\alpha}{\alpha - 1}} \right\},
\]
and \( C(j + 2) \int \frac{\left( |t| + |s| \right)^j}{1 + |t|^{j+2}} \, dt \leq C(j) \exp \left( \varepsilon x^{\frac{\alpha}{\alpha - 1}} \right) \) for arbitrary \( \varepsilon > 0 \). Since \( 1 - \frac{1}{\alpha} > 0 \) the above relations together with (7.10) imply that
\[
\left| \frac{d^j}{dx^j} g_1(x) \right| \leq C \exp (-A x^{\frac{\alpha}{\alpha - 1}}) = C \exp (-A x^\alpha).
\]
Lemma 13 is proved.

8. THE PROOF OF THEOREMS 1 AND 1'

The following lemma can be considered as a rigorous version of the heuristic argument at the end of Section 2.

**Lemma 14.** — If \( \hat{M}_0 \) is sufficiently large, \( 0 < T < \frac{1}{10} \), then there exist some threshold \( n_0 = n_0(\hat{M}_0) \) and constant \( L = L(\hat{M}_0, c) \) such that
\[
|\tilde{\phi}_n(f_n)(t) - \tilde{g}_M(t)| \leq L \left[ c^{-n} + \left( \frac{c^2}{2} \right)^n \right] \text{ for } n > n_0
\]
and
\[
|t| < \frac{M \mu^{3/2}}{4 \sqrt{C}} = A_0, \quad t \in \mathbb{R}^1,
\]
where \( C, C > 0 \) is an absolute constant, and \( \mu, M \) and the threshold \( n_0 \) are the same as in Lemmas 10 and 11

**Proof of Lemma 14.** — First we show that for \( n \geq n_0 \)
\[
\left| \frac{d^2}{dt^2} \log \tilde{\phi}_n(f_n)(t) \right| \leq \frac{20C}{M^2 \mu^3} \quad \text{if } |t| < A_0 \quad (8.1)
\]

Annales de l'Institut Henri Poincaré - Physique théorique
and
\[ \left| \frac{d^2}{dt^2} \log \tilde{\phi}_{n+1}(f_{n+1})(t) - \frac{d^2}{dt^2} \log \tilde{T}_M \tilde{\phi}_n(f_n)(t) \right| < \frac{500C}{M^2 \mu^3} c^{-n} \quad \text{if} \quad |t| < A_0. \] (8.2)

By relation (6.21)
\[ \left| \frac{d^2}{dt^2} \tilde{\phi}_n(f_n)(t) \right| \leq \int x^2 \phi_n(f_n)(x) dx \leq C M \int x^2 \exp \left( -\frac{\mu M}{2} |x| \right) dx = \frac{8C}{M^2 \mu^3}, \] (8.3)

and since \( \frac{d}{dt} \tilde{\phi}_n(f_n)(0) = 0, \tilde{\phi}_n(f_n)(0) = 1 \)
\[ \left| \frac{d}{dt} \tilde{\phi}_n(f_n)(t) \right| \leq \frac{8C |t|}{M^2 \mu^3} \leq \frac{2\sqrt{C}}{M} \mu^{-3/2} \quad \text{if} \quad |t| < A_0 \] (8.3')

and
\[ |1 - \tilde{\phi}_n(f_n)(t)| \leq \frac{4Ct^2}{M^2 \mu^3} \leq \frac{1}{4} \quad \text{if} \quad |t| < A_0 \] (8.3'')

Hence \( \log \tilde{\phi}_n(f_n)(t) \) exists for \( |t| < A_0 \), and since
\[ \frac{d^2}{dt^2} \log \tilde{\phi}_n(f_n)(t) = \frac{\tilde{\phi}_n(f_n)(t)}{\tilde{\phi}_n(f_n)(t)^2} \left( \frac{d}{dt} \tilde{\phi}_n(f_n)(t) \right)^2 \] (8.4)
the estimates (8.3)-(8.3)' imply (8.1).

Similarly, we get with the help of (6.18) and the relations
\[ \frac{d}{dt} [\tilde{\phi}_{n+1}(f_{n+1})(0) - \tilde{T}_M \tilde{\phi}_n(f_n)(0)] = \tilde{\phi}_{n+1}(f_{n+1})(0) - \tilde{T}_M \tilde{\phi}_n(f_n)(0) = 0 \]
that
\[ \left| \frac{d^2}{dt^2} [\tilde{\phi}_{n+1}(f_{n+1})(t) - \tilde{T}_M \tilde{\phi}_n(f_n)(t)] \right| \leq \frac{8C}{M^2 \mu^3} c^{-n} \] (8.5)
\[ \left| \frac{d}{dt} [\tilde{\phi}_{n+1}(f_{n+1})(t) - \tilde{T}_M \tilde{\phi}_n(f_n)(t)] \right| \leq \frac{2\sqrt{C}}{M \mu^{3/2}} c^{-n}, \quad \text{if} \quad t \leq A_0 \] (8.5')
\[ |\tilde{\phi}_{n+1}(f_{n+1})(t) - \tilde{T}_M \tilde{\phi}_n(f_n)(t)| \leq \frac{1}{4} c^{-n}, \quad \text{if} \quad |t| < A_0. \] (8.5'')

By expressing \( \frac{d^2}{dt^2} \log \tilde{T}_M \tilde{\phi}_n(f_n)(t) \) similarly to (8.4) and applying (8.3)-(8.3)' (for the function \( \tilde{\phi}_{n+1}(f_{n+1})(t) \)) and (8.5)-(8.5)'' we get (8.2).

We claim that
\[ \left| \frac{d^2}{dt^2} \log \tilde{\phi}_M(t) \right| \leq \frac{9}{M^2 \mu^2}. \] (8.6)
Indeed, by (7.5)
\[
\frac{d^2}{dt^2} \log \tilde{g}_M(t) = -\frac{1}{4M^2} \sum_{j=1}^{\infty} \left( \frac{c^2}{2} \right)^j \left[ 1 + i \left( \frac{c}{2} \frac{t}{M} \right)^2 \right]^{-2}
\]
and
\[
\left| \frac{d^2}{dt^2} \log \tilde{g}_M(t) \right| \leq \frac{1}{4M^2} \sum_{j=1}^{\infty} \left( \frac{c^2}{2} \right)^j \left[ 1 + \left( \frac{c}{2} \frac{t^2}{M^2} \right)^j \right]^{-1} \leq \frac{1}{4M^2} \sum_{j=1}^{\infty} \left( \frac{c^2}{2} \right)^j \leq \frac{1}{4M^2} \cdot \frac{1}{1 - \frac{c^2}{2}}
\]
as we claimed. Since \( \tilde{T}_M \tilde{g}_M = \tilde{g}_M \) relation (7.3) yields that
\[
\frac{d^2}{dt^2} \log \tilde{T}_M \tilde{g}_M(f_n)(t) - \frac{d^2}{dt^2} \log \tilde{g}_M(t) = \frac{d^2}{dt^2} \{ \log \tilde{T}_M \tilde{g}_M(f_n)(t) - \log \tilde{T}_M \tilde{g}_M(t) \} = \frac{c^2}{2} \left\{ \left[ \log \tilde{g}_M \left( \frac{c}{2} t \right) \right]' - \left[ \log \tilde{g}_M \left( \frac{c}{2} t \right) \right]'' \right\} \quad \text{if } |t| < \frac{M\mu^{3/2}}{4C}.
\]
Put \( \delta_n = \sup_{|t| < A_0} \left| \frac{d^2}{dt^2} \log \tilde{g}_M(t) \right| \). By relations (8.1) and (8.6)
\[
\delta_n \leq \frac{30C}{M^2 \mu^3}.
\]
and by (8.2) and (8.7)
\[
\delta_{n+1} \leq \frac{c^2}{2} \delta_n + \frac{500}{M^2 \mu^3} c^{-n}.
\]
The quantity \( \delta_n \) can be estimated with the help of (8.8) and the recursive estimate (8.8)', and we get
\[
\delta_n \leq \frac{L}{M^2} \left[ \left( \frac{c^2}{2} \right)^n + c^{-n} \right] n \quad \text{for } n \geq n_0
\]
with some \( L = L(c) \). (The multiplying factor \( n \) appears only in the case \( \frac{c^2}{2} = \frac{1}{c} \).) Since \( \frac{d}{dt} \log \tilde{g}_M(f_n)(0) = \frac{d}{dt} \log \tilde{g}_M(f_n)(0) = \frac{d}{dt} \log \tilde{g}_M(0) = \log \tilde{g}_M(0) = 0 \) this inequality implies that
\[
| \log \tilde{g}_M(f_n)(t) - \log \tilde{g}_M(t) | \leq \frac{L t^2}{2M^2} \left[ \left( \frac{c^2}{2} \right)^n + c^{-n} \right] n \leq L' \left[ \left( \frac{c^2}{2} \right)^n + c^{-n} \right] n
\]
for \( t < A_0 \). As \( | \tilde{g}_M(f_n)(t) | \leq 1 \) and \( | \tilde{g}_M(t) | \leq 1 \) for all \( t \) and
\[
| e^A - e^B | \leq | A - B | \max \{ e^{|A|}, e^{|B|} \}
\]
for all \( A, B \in C \) the last relation implies Lemma 14.
In the next lemma we enlarge the domain where we can give the same estimate as in Lemma 14.

**Lemma 15.** If $\hat{M}_0$ is sufficiently large, $0 < T < \frac{1}{10}$, then there exist some $n_0 = n_0(\hat{M}_0, c)$, $\eta = \eta(\hat{M}_0, c)$ and $L = L(\hat{M}_0, c)$ constants such that for all $n > n_0$

$$|\tilde{\phi}_n(f_n(t)) - \tilde{g}_M(t)| < Ln \left[ c^{-n} + \left( \frac{c^2}{2} \right)^n \right]$$

if $|t| < \frac{\eta}{c^n}$, $t \in \mathbb{R}^1$. (8.9)

**Proof of Lemma 15.** It follows from (6.18) that

$$|\tilde{\phi}_n+1(f_n+1(t)) - \tilde{T}_M\tilde{\phi}_n(f_n(t))|$$

$$\leq \int |\phi_n+1(f_n+1)(x) - T_M\phi_n(f_n(x))| \, dx < \frac{2C}{\mu} c^{-n} \quad (8.10)$$

for $n > n_0$ and all $t$. On the other hand by (7.3) and the relation $\tilde{T}_M\tilde{g}_M = \tilde{g}_M$

$$|\tilde{T}_M\tilde{\phi}_n(f_n(t)) - \tilde{g}_M(t)| = \left| \frac{\tilde{\phi}_n(f_n)\left( \frac{c}{2} t \right)^2 - \tilde{g}_M\left( \frac{c}{2} t \right)^2}{\sqrt{1 + i \frac{c}{2M} t}} \right| \leq$$

$$\leq 2 \left( 1 + \frac{c^2 t^2}{4M^2} \right)^{-1/2} \left| \phi_n(f_n)\left( \frac{c}{2} t \right) - \tilde{g}_M\left( \frac{c}{2} t \right) \right| \quad (8.11)$$

Define the sets $I_k = \left\{ t, \left( \frac{2}{c} \right)^{k-1} A_0 < |t| < \left( \frac{2}{c} \right)^k A_0 \right\}$, $k = 1, 2, \ldots$ and $I_0 = \{ t, |t| < A_0 \}$, where $A_0$ is the same as in Lemma 14, and put $\delta_{k,n} = \sup_{t \in I_k} |\tilde{\phi}_n(f_n(t)) - \tilde{g}_M(t)|$.

Then

$$\delta_{0,n} \leq Ln \left[ c^{-n} + \left( \frac{c^2}{2} \right)^n \right] \text{ for } n \geq n_0$$

by Lemma 14, and relations (8.10) and (8.11) imply that

$$\delta_{k+1,n+1} \leq \frac{2}{\sqrt{1 + A_1(2/c)^{2k}}} \delta_{k,n} + \frac{2C}{\mu} c^{-n}, \quad n \geq n_0 \quad (8.12)$$

with $A_1 = \frac{c^2}{4M^2} A_0^2 = \frac{c^2 \mu^3}{64C}$. 

Define $B_{j,k} = \frac{2C}{\mu \lambda} \prod_{i=j}^{k} \sqrt{1 + A_i \left(\frac{2}{c}\right)^{2t}}$ for all $0 \leq j \leq k$. Since there is some $l_0$ such that $2 \left[1 + A_1 \left(\frac{2}{c}\right)^{2l}\right]^{-1/2} \leq \frac{1}{2}$ if $l \geq l_0$, the inequality $B_{j,k} \leq K \cdot 2^{-(k-j)}$ holds for any $j, k \geq 0$ with some appropriate $K = K(c)$. Hence relation (8.12) implies that

$$\delta_{k,n+k} \leq \delta_{0,n} \cdot B_{1,k} + \sum_{j=1}^{k} c^{-(n+j)}B_{j,k} \leq K' \left(2^{-k} \delta_{0,n} + c^{-(n+k)}\right).$$

The last inequality together with (8.11) imply that

$$\delta_{k,n+k} \leq L(n + k) \left[\left(\frac{c^2}{2}\right)^{n+k} + c^{-(n+k)}\right] \quad \text{if} \quad n > n_0, \quad k \geq 0.$$

Observe that the right hand side in the last relation depends on $n$ and $k$ only through $n + k$. It implies Lemma 15 with $\eta = \left(\frac{c}{2}\right)^{n_0} A_0$, where $A_0$ is the same as in Lemma 14.

The proof of Theorem 1'. — It follows from Lemma 15 and (7.3) that for $n > n_0$

$$|\tilde{T}_M \tilde{\phi}_n(f_n(t)) - \tilde{g}_M(t)| \leq 2 |\tilde{\phi}_n(f_n(t)) - \tilde{g}_M(t)| \leq 2Ln \left[c^{-n} + \left(\frac{c^2}{2}\right)^{n}\right] \quad \text{if} \quad |t| < \eta \left(\frac{2}{c}\right)^{n} (8.13)$$

On the other hand we get by applying (3.17) in Proposition 2 with $f = f_n, \beta = \frac{4}{M^2 \mu^2}$ (this can be done, see (6.17)) the inequality

$$\left|\frac{d^4}{dx^4} T_M \phi_n(x)\right| < C^2 M^5 \exp \left(\frac{-\mu M}{2} |x|\right).$$

Hence integration by parts yields that

$$|\tilde{T}_M \tilde{\phi}_n(f_n(t))| \leq \frac{1}{t^4} \int \left|\frac{d^4}{dx^4} T_M \phi_n(f_n(x))\right| dx \leq \frac{C}{t^4}. (8.13)'$$

By part a) of Lemma 13 and the relation $\tilde{g}_M(t) = \tilde{g}_1 \left(\frac{t}{M}\right)$ also

$$|\tilde{g}_M(t)| < \tilde{C} t^{-4}. (8.13)''$$
Relations (8.13)-(8.13) imply that we have with arbitrary $\eta \left( \frac{2}{c} \right)^n > B > 0$

$$\left| \frac{d^j}{dx^j} \left[ T_M \phi_n(f_n)(x) - g_M(x) \right] \right| \leq \int |t|^j |\tilde{T}_M \tilde{\phi}_n(f_n)(t) - \tilde{g}_M(t)| \ dt =$$

$$= \int_{|t| < B} + \int_{|t| > B} \leq C \left\{ B^{j+1} \eta \left[ C^{-n} + \left( \frac{c^2}{2} \right)^n \right] + \frac{1}{B^{3-j}} \right\} \text{ for } j = 0, 1, 2. \quad (8.14)$$

Put $\bar{q} = \max \left( \frac{1}{\sqrt{c}}, \frac{c}{\sqrt{2}} \right)$, and choose $B = \bar{q}^{-n}$. Then (8.14) with this $B$
implies that

$$\left| \frac{d^j}{dx^j} \left[ T_M \phi_n(f_n)(x) - g_M(x) \right] \right| \leq C' q^n, \quad j = 0, 1, 2, \quad n > n_0, \quad \text{if} \quad \bar{q} < q < 1. \quad (8.15)$$

We get, similarly to the proof of (6.19), the strengthened form

$$\left| \frac{d^j}{dx^j} \left[ T_M \phi_n(f_n)(x) - T_M \phi_n(f_n)(x) \right] \right| \leq C^{-n}CM^{j+1} \exp \left( - \frac{\mu M}{2} |x| \right). \quad (8.15)'$$

Since $g_M(x) = Mg \left( M \left( x + \frac{c}{4(c-1)} \right) \right)$ by Lemma 12, where $g$ is the solution of the equation (1.6), relations (8.15), (8.15)' and (3.13) imply formula (2.9) in Theorem 1'. The remaining statements of Theorem 1' are contained in Lemmas 10 and 11.

In the proof of Theorem 1 we need the following

**Lemma 16.** — If $n > n_0(\tilde{M}_0, c), \ v > 0$ then there exists some $C(\varepsilon) = C(\varepsilon, c)$ such that

$$\left| \frac{d^j}{dx^j} f_n(x) \right| \leq C(\varepsilon)M^{j+1} \exp \left( \frac{(1-\varepsilon)M}{c} \left[ 2x + \frac{x^2}{c^{n}M_n} \right] \right)$$

for $x > - c^nM_n, \quad j = 0, 1, 2.$

**Proof of Lemma 16.** — By Property I(n) and the behaviour of the sequence $\beta_n$ there is some $\mu > 0$ and $m \geq 0$ such that

$$\left| \frac{d^j}{dx^j} f_m(x) \right| \leq CM^{j+1} \exp \left( - \mu M \left[ 2x + \frac{x^2}{c^{n}M_m} \right] \right),$$

$$j = 0, 1, 2, \quad x > - c^nM_m. \quad (8.16)$$

We can improve the constant $\mu$ in (8.16) by successive application of Proposition 2. Choose $\eta = \frac{\varepsilon}{5}$ and the integer $k$ in such a way that

$$\mu^2 \left[ \frac{2}{c} (1 - \eta) \right]^{k-1} \leq \frac{1 - \varepsilon/2}{4} < \frac{\mu^2}{3} \left[ \frac{2}{c} (1 - \eta) \right]^k.$$
Define $\bar{\mu}, \frac{\mu^2}{3} \leq \mu^2 < \mu^2$ so that $\bar{\mu} + \left[\frac{2}{c} (1-\eta)\right]^{k-1} = \frac{1-\varepsilon/2}{4}$. Put $m = n - k - 1$.

Since $f_m(x) = Q_{n-1,M_{n-1}, \ldots, Q_{m,M_m}, f_m(x)}$ we get Lemma 16 by applying formula (3.16) successively for $Q_{m+j,M_{m+j}, f_{m+j}(x)}, 0 \leq j \leq k - 1$, with $\varepsilon = \eta$ and $\beta = \frac{1}{M^2 \bar{\mu}^2} \left(\frac{c}{2(1-\eta)}\right)^j$, and finally for $f_{n-1}$ with $\beta = \frac{4}{\varepsilon/(2M^2)}$ and $\varepsilon = \eta$. This is possible since for all $0 \leq j \leq k - 1$

$$100 > \beta \geq \frac{1}{M^2 \bar{\mu}^2} \left(\frac{c}{2(1-\eta)}\right)^{k-1} = \frac{4}{\varepsilon/(2M^2)}.$$

(Since the number of iterations $k$ does not depend on $n$ neither the constant $C(\varepsilon)$ does.)

The proof of Theorem 1. — Simple calculation yields that

$$c^{-n} p_n(x, T) = \frac{1}{B_n} \exp \left( - \frac{a_0}{2T} c^n x^2 \right) f_n \left( e^n \left( \frac{a_1}{T} x - M_n \right), T \right), \quad (8.17)$$

where the norming constant $B_n$ is determined by the equation

$$\int_{\mathbb{R}^2} p_n(x, T) dx_1 dx_2 = \int p_n(\sqrt{x_1^2 + x_2^2}, T) dx_1 dx_2 = 1, \quad x = (x_1, x_2). \quad (8.17)'$$

By relations (2.9) and (2.8),

$$f_n \left( e^n \left( \sqrt{\frac{a_1}{T} x - M_n} \right), T \right) = Mg \left( e^n \left( \sqrt{\frac{a_1}{T} x - M_n + \frac{c^{1-n}}{4(c-1)M}} \right) \right) + r_n^{(1)}(x) =
$$

$$= \sqrt{\frac{a_1}{T}} Mg \left( \frac{a_1 c^n}{T} M(x - \bar{M}) \right) + r_n^{(2)}(x) \quad \text{for} \quad x > 0 \quad (8.18)$$

with $\bar{M} = \sqrt{\frac{T}{a_1}} M$ and errors terms $r_n^{(1)}(x), r_n^{(2)}(x)$ satisfying the inequality

$$\left| \frac{d^j}{dx^j} r_n^{(l)}(x) \right| \leq K q^n e^{n \bar{\eta}} \text{with some} \quad K > 0, \quad 0 < \bar{\eta} < 1, \quad j = 0, 1, 2, \quad l = 1, 2.$$

We claim that

$$\left| \frac{d^j}{dx^j} \left[ \exp \left( - \frac{a_0}{2T} c^n x^2 \right) f_n \left( e^n \left( \sqrt{\frac{a_1}{T} x - M_n} \right), T \right) - \exp \left\{ - \left( \frac{a_0 c^n}{2T} 2\bar{M}(x - \bar{M}) + \bar{M}^2 \right) \right\} \sqrt{\frac{a_1}{T}} Mg \left( \frac{a_1 c^n}{T} M(x - \bar{M}) \right) \right| \right| \leq K q^n e^{n \bar{\eta}} \exp \left( - \frac{a_0}{2T} c^n \bar{M}^2 \right), \quad j = 0, 1, 2, \quad |x - \bar{M}| < \delta n c^{-n} \quad (8.19)$$
if $\delta > 0$ is sufficiently small. Indeed, in this case
\[
\left| \frac{d^j}{dx^j} \left[ \exp \left( - \frac{a_0}{2T} c^\alpha (x^2 - \bar{M}^2) \right) \left( f_n \left( c^n \left( \sqrt{\frac{a_1}{T}} x - M_n \right) , T \right) - \sqrt{\frac{a_1}{T}} \bar{M} \left( \frac{a_1 c^n}{T} \bar{M}(x - \bar{M}) \right) \right) \right] \right| \leq K\bar{q}^{-n/2}c^{nj} (8.20)
\]

because of (8.18) and the inequality $\left| \frac{d^j}{dx^j} \exp \left( - \frac{a_0}{2T} c^\alpha (x^2 - \bar{M}^2) \right) \right| \leq K\bar{q}^{-n/2}c^{nj}$ if $\delta(\bar{M}, c) > 0$ is sufficiently small. On the other hand
\[
\left| \frac{d^j}{dx^j} \left[ \exp \left( - \frac{a_0}{2T} c^\alpha (x^2 - \bar{M}^2) \right) - \exp \left( - \frac{a_0}{T} c^n \bar{M}(x - \bar{M}) \right) \right] \right| \leq \left| \frac{d^j}{dx^j} \left[ \exp \left( - \frac{a_0}{T} c^n \bar{M}(x - \bar{M}) \right) \right] \right| \leq K\bar{q}^{-n/2}c^{nj} \quad \text{if} \quad |x - \bar{M}| < \delta c^{-\alpha}, \quad j = 0, 1, 2 \quad (8.20)'
\]

since
\[
\left| \frac{d^j}{dx^j} \left[ \exp \left( - \frac{a_0}{T} c^n \bar{M}(x - \bar{M}) \right) \right] \right| = \left| \frac{d^j}{dx^j} \exp \left( - \frac{a_0}{T} c^n \bar{M}(x - \bar{M}) \right) \right| = \left| \frac{d^j}{dx^j} \left[ \exp \left\{ - \frac{a_0}{2T} c^n (x - \bar{M})^2 \right\} - 1 \right] \right| \leq K\bar{q}^{-n/2}c^{nj} \quad \text{if} \quad |x - \bar{M}| < \delta c^{-\alpha}, \quad j = 0, 1, 2 \quad (8.20)'
\]

Relation (8.19) follows from (8.20) and (8.20)'.

We also claim that
\[
\left| \frac{d^j}{dx^j} \exp \left( - \frac{a_0}{2T} c^n x^2 \right) f_n \left( c^n \left( \sqrt{\frac{a_1}{T}} x - M_n \right) , T \right) \right| \leq K \exp \left( - \frac{a_0}{2T} c^n \bar{M}^2 \right) c^{nj} \exp \left( - \mu c^n \bar{M} \right) \quad (8.21)
\]

for $j = 0, 1, 2$ with some appropriate $K = K(\bar{M}, c) > 0$ and $\mu = \mu(c) > 0$.

For $x > \sqrt{\frac{T}{a_1}} M_n$ relation (8.21) immediately follows from the inequalities
\[
\left| \frac{d^j}{dx^j} \exp \left( - \frac{a_0}{2T} c^n x^2 \right) \right| \leq Kc^{nj} \exp \left( - \frac{a_0}{2T} c^n \bar{M}^2 \right) \quad \text{for} \quad x > \sqrt{\frac{T}{a_1}} M_n \quad \text{and}
\]
\[
\left| \frac{d^j}{dx^j} f_n \left( c^n \left( \sqrt{\frac{a_1}{T}} x - M_n , T \right) \right) \right| \leq Kc^{nj} \exp \left( - \mu c^n \bar{M} \right) \left( \sqrt{\frac{a_1}{T}} x - M_n \right) \leq Kc^{nj} \exp \left( - \mu c^n \bar{M} \right) \left( \sqrt{\frac{T}{a_1}} |x - \bar{M}| \right) .
\]
For $0 < x < \sqrt{\frac{T}{a_1}}$, we need the sharper bound given in Lemma 16 for the function $f_n$. In this case the estimates
\[ \left| \frac{d^j}{dx^j} \exp \left( -\frac{a_0}{2T} e^n(x^2 - M^2) \right) \right| \leq K c^n \exp \left( -\frac{(1+\varepsilon)a_0}{2T} e^n(x^2 - M^2) \right) \]
\[ \left| \frac{d^j}{dx^j} f_n \left( c^n \left( \sqrt{\frac{a_1}{T}} x - M_n \right), T \right) \right| \leq \]
\[ \leq K c^n \exp \left\{ \frac{(1-\varepsilon)M}{c} 2c^n \left( \sqrt{\frac{a_1}{T}} x - M_n \right) + \frac{c^2n}{c^nM_n} \right\} \]
\[ = K c^n \exp \left\{ \frac{1-\varepsilon a_1}{c} M_n x^2 - MM_n \right\} \leq K c^n \exp \left\{ \frac{1-\varepsilon a_1}{c} e^n(x^2 - M^2) \right\} \]

imply (8.21), since $\mu = \frac{1-\varepsilon a_1}{c} - \frac{(1+\varepsilon)a_0}{2T} > 0$.

It is not difficult to see with the help of Part b 1) of Lemma 13
\[ \left| \frac{d^j}{dx^j} \sqrt{\frac{a_1}{T} M^g} \left( \frac{a_1 c^n}{T} M(x - M) \right) \exp \left( -\frac{a_0 c^n}{T} M(x - M) \right) \right| \leq \]
\[ \leq K c^n \exp \left( -\alpha c^nM \left| x - M \right| \right), j = 0, 1, 2 \quad (8.22) \]

with some $\alpha > 0$. We show with the help of (8.19), (8.21) and (8.22) that
\[ \int_{R^2} \exp \left\{ -\frac{a_0}{2T} e^n(x_1^2 + x_2^2) \right\} f_n \left( c^n \left( \sqrt{\frac{a_1}{T}} (x_1^2 + x_2^2) - M_n \right), T \right) dx_1 dx_2 = \]
\[ = \exp \left( -\frac{a_0}{2T} e^nM^2 \right) e^{-nB(M)(1 + 0(q^n))} \quad (8.23) \]

with
\[ B(M) = \sqrt{\frac{a_1}{T} M^2} \int_{-\infty}^{\infty} \exp \left( -\frac{a_0}{T} Mr \right) g \left( \frac{a_1}{T} Mr \right) dr \]

and some appropriate $0 < q < 1$. Because of (8.17) and (8.17)' relation (8.23) implies that the constant $B_n$ defined in (8.17) satisfies the relation
\[ B_n = \overline{B}(M) \exp \left( -\frac{a_0 c^n}{2T} \overline{M}^2 \right)(1 + 0(q^n)) \quad (8.23)' \]

To prove (8.23) let us first observe that we make an error of order
0(q^n/2c-nn)\exp\left(-\frac{a_0}{2T}c^nM^2\right) by replacing the integrand on the left-hand side of (8.23) by
\[J_n(x_1, x_2) = \sqrt{\frac{a_1}{T}M} \exp\left\{-\frac{a_0c^n}{2T}2M(\sqrt{x_1^2 + x_2^2} - M) + M^2\right\} + \frac{a_1c^n}{T}M(\sqrt{x_1^2 + x_2^2} - M).\]

Indeed, by (8.19) the difference of the two integrals can be bounded by this error term if we integrate only in the domain \(D_n = \{x = (x_1, x_2), \quad |x| - M < \delta nc^{-n}\}\), and by (8.21) and (8.22) both integrals are bounded by this error term if we integrate outside the domain \(D_n\). On the other hand, we get with the change of variables \(r = c^n(\sqrt{x_1^2 + x_2^2} - M)\) that
\[
\int J_n(x_1, x_2)dx_1dx_2 = \frac{1}{c^n} \int_{-c^nM}^{\infty} \left(\frac{r}{c^n} + M\right) \exp\left(-\frac{a_0M}{T}r\right) \sqrt{\frac{a_1}{T}M} dr = \overline{B}(M)(1 + 0(c^{-n})).
\]
(In the last step we have applied again Part b) of Lemma 13.) These estimations imply (8.23).

Relation (1.7) follows from (8.17), (8.23)' and (8.21), relation (1.5) with the bound (1.8) on the error (and \(B(M, T) = \overline{B}(M)^{-1}\) follows from (8.17), (8.23)' and (8.19) for \(|x - M| < \delta nc^{-n}\) and (8.21), (8.22) instead of (8.19) for \(|x - M| > \delta nc^{-n}\). The remaining statements of Theorem 1 are easy consequences of Lemmas 10, 12, 13 and the definition of \(M\). Theorem 1 is proved.

THE BEHAVIOUR OF THE DENSITY OF THE AVERAGE SPIN AT INFINITY

In this section we prove Theorem 2 with the help of two lemmas whose proofs are postponed to the next section. First we want to determine the typical region where the function \(\overline{p}_n(x, T)\) is essentially concentrated. More precisely, we want to define an interval \(D_n\) in such a way that
\[\overline{p}_n(x, T) > q^n \sup_x \overline{p}_n(x, T)\]
with some \(0 < q < 1\) if \(x \in D_n\), and \([0, \infty) - D_n\) has exponentially small probability with respect to the probability measure with density function \(K_n\overline{p}_n(x, T)\). (Here \(K_n\) is that norming constant with which \(K_n\overline{p}_n(x, T)\)
is a probability density function on $[0, \infty]$. To solve this problem we need the following

**Lemma 17.** — Consider the function $g_1(x)$ defined in Lemma 12. There exist some $A = A(c) > 0$ and $B = B(c) > 0$ such that

\begin{enumerate}
  \item $g_1(x) > B \exp(-Ax^2)$ with $x = \frac{\log 2}{\log c}$ for all $x > 0$
  \item $g_1(x) > \frac{B}{\sqrt{|x| + 1}} \exp\left(-\frac{2}{c} |x|\right)$ for all $x < 0$.
\end{enumerate}

Part b 2) of Lemma 13 and Part a) of Lemma 17 imply together that

$$B_1 \exp(-A_1 x^2) < g_1(x) < B_2 \exp(-A_2 x^2) \quad \text{for } x > 0$$

with some $B_1 > 0$, $B_2 > 0$ and $0 < A_2 < A_1$, and Part b 1) of Lemma 13 together with Part b) of Lemma 17 yield that

$$B_1(\varepsilon) \exp(- (1 + \varepsilon) \frac{2}{c} |x|) < g_1(x) < B_2(\varepsilon) \exp(- (1 - \varepsilon) \frac{2}{c} |x|) \quad \text{for } x < 0$$

with arbitrary $\varepsilon > 0$ and appropriate $B_1(\varepsilon) > 0$, $B_2(\varepsilon) > 0$.

Define the function $P_n(x) = K e^n \exp\left(-\frac{a_1 e^n}{T} M(x - M)\right) g\left(\frac{a_1 e^n M}{T} (x - M)\right)$

with $\frac{1}{K} = \int_{-\infty}^{\infty} \exp\left(-\frac{a_1}{T} M y\right) g\left(\frac{a_1 M}{T} y\right) dy$. (The last integral is convergent because of Part b 1) of Lemma 13.) Then $P_n(x)$ is a density function and a comparison of the functions $P_n(x)$ and $\bar{P}_n(x, T)$ gives with the help of Theorem 1 and Lemma 13 that

$$K_n = K + O(q^n) \quad \text{(9.2)}$$

and

$$|P_n(x) - K_n \bar{P}_n(x, T)| < C c^n q^n \quad \text{for } x > 0 \quad \text{(9.2)'}$$

and

$$\int_0^\infty |P_n(x) - K_n \bar{P}_n(x, T)| \, dx \leq C q^n \quad \text{(9.2)''}$$

with some $0 < q < 1$, where $K_n$ is defined so that $K_n \bar{P}_n(x, T)$ is a density function on $[0, \infty]$. It follows from Part b) of Lemma 13 and the identity

$$g(x) = g_1\left(x - \frac{c}{4(c - 1)}\right)$$

that for all $\varepsilon > 0$

$$\int_{x > M + \varepsilon c^{-n}} P_n(x) \, dx < C q^n$$

and

$$\int_{0 < x < M - \varepsilon c^{-n}} P_n(x) \, dx < C q^n$$
with some \( C = C(\varepsilon) > 0 \), and \( q = q(\varepsilon), 0 < q < 1 \). These estimates together with (9.2)" imply that
\[
\int_{x > M + e^{-n^{1/2}}} \tilde{p}_n(x, T) dx < C q^n \tag{9.3}
\]
and
\[
\int_{0 < x < M - e^{-n^{1/2}}} \tilde{p}_n(x, T) dx < C q^n. \tag{9.3}'
\]
On the other hand, by the definition of \( P_n(x) \), Lemma 17 and (9.2)' imply that
\[
p_n(x, T) \geq C_1 q^n (q^n + Cq^n) > \frac{C_1}{2} c^n q^n, \quad 0 < q < q_1 < 1 \tag{9.4}
\]
for \( M - e^{-n} < x < M + e^{-n} \varepsilon \) if \( \varepsilon > 0 \) is a sufficiently small but fixed (depending only on \( c \) and \( M \)) constant. Relations (9.2)' and (9.4) imply (1.10), and (9.3), (9.3)' explain why it is natural to consider the above interval.

We prove Part a) of Lemma 17 in the next section. Here we give a heuristic explanation for formulas (9.1) and (9.1)' and prove Part b).

It is natural to expect that \( g_1(x) \sim B \exp \left( -A x^2 \right) \) with some \( B > 0 \), \( A > 0 \) for large \( x, x > 0 \). If we consider the expression \( T_1 g_1(x) \) then for large \( x \) the main contribution to the integral is given when \( u \sim 0, v \sim 0, \)

therefore \( T_1 g_1(x) \sim B^2 \exp \left( -2A \left( \frac{x}{c} \right)^2 \right) \). Hence the identity \( T_1 g_1(x) = g_1(x) \)
suggests that \( 2A \left( \frac{x}{c} \right)^2 = Ax^2 \), i.e. \( A = \frac{\log 2}{\log c} \). In (9.1) we have formulated a slightly weaker statement, since we have given only an upper and lower bound on the coefficient \( A \) inside the exponent. The above argument does not work for \( x < 0 \), since in this case the domain \( u \sim 0, v^2 \sim -x \) gives an essential contribution to the integral \( T_1 g_1(x) \). This observation in the basis of the

**Proof of Part b) of Lemma 17.** — For \( x < 0 \) define the set
\[
A = A(x) = \left\{ (u,v), |u| < 1, \frac{|x|}{c} + 1 < \frac{v^2}{2} < \frac{|x|}{c} + 2 \right\}.
\]
Since \( g_1(z) > C > 0 \) with some \( C \) for \( 0 < z < 3 \) (this will be proved in the proof of Part a)), \( g_1(z) \geq 0 \) for all \( z \) and \( g_1(x) = T_1 g_1(x) \) hence
\[
g_1(x) \geq \int_A e^{-v^2} g_1 \left( \frac{x}{c} + u + \frac{v^2}{2} \right) g_1 \left( \frac{x}{c} - u + \frac{v^2}{2} \right) dudv \geq \\
\geq C^2 \int_A e^{-v^2} dv \geq \frac{C'}{\sqrt{|x| + 1}} \exp \left( -\frac{2}{c} |x| \right).
\]
It is natural to expect that the decrease of the function $\tilde{p}_n(x, T)$ outside the typical region is similar to that of $P_n(x)$. For $x < M$ we cannot expect a considerably better estimate than (1.7), but it is natural to expect that $\tilde{p}_n(x, T) \leq C e^{\alpha} \exp \left\{ - A(c^n |x - M|^\alpha) \right\}$ for $x > M$ and sufficiently large $n$ with some $C > 0$, $A > 0$ and the same $\alpha$ as in Lemma 17. However, this cannot hold without any further restriction, since the starting function $\tilde{p}_0$ satisfies the inequality $\tilde{p}_0(x, t) > C \exp(-Ax^a)$ for large $x$ with $p_n(x, T)$. (This inequality holds for $p_n(x, t)$ if $x$ is sufficiently large depending on $n$.) Hence, in the case $\alpha > 4$ the above formulated conjecture does not hold.

In the next section we prove the following weaker result:

**Lemma 18.** Let $\alpha < 4$ and $\alpha < \alpha = \frac{\log 2}{\log c}$. Under the conditions of Theorem 1' there is some $n_0 = n_0(c, t, T, \alpha)$ such that for $n > n_0$ $\left| \frac{d^j}{dx^j} f_n(x) \right| \leq CM^{j+1} \exp(-AM^{\alpha}x^\alpha), \quad x > 0, \quad j = 0, 1$

with some $C > 0$ and $A > 0$ which depend only on $\alpha$ and $c$.

It can be seen with the help of (8.17) and (8.23)' that Lemma 18 implies the inequality $c^{-n} \tilde{p}_n(x, T) \leq K \exp(-A(c^n |x - M|^\alpha))$ for $x > M$ what is a considerable improvement of (1.7). However, since $\alpha < \alpha$, even this estimate is not strong enough to imply (9.3). With the help of a simple trick we can prove a strengthened version of Lemma 18 (for $j = 0$) which is sharp enough to imply (9.3).

**Corollary of Lemma 18.** Let the conditions of Lemma 18 be satisfied, and let some $\epsilon > 0$ be given. Then there exists some $q = q(\epsilon), 0 < q < 1$ and $K > 0$, $L > 0$ depending on $c$, $t$, $T$ and $\alpha$ such that $c^{-n} \tilde{p}_n(x, T) \leq K q^n \exp \left\{ - L(c^n |x - M|^\alpha) \right\}$ for $x > M + \epsilon n^{1/2} c^{-n}$.

Since $\frac{\log 2}{\log c} > 2$ for $1 < c < \sqrt{2}$ this Corollary implies (1.11)', and thus completes the proof of Theorem 2.

**Proof of the Corollary of Lemma 18.**

We have $\left| \frac{d}{dx} \tilde{p}_n(x, T) \right| \leq K c^{2n} \exp \left\{ - AM^{\alpha} |x - M|^\alpha \right\}$ for $x > M$ (9.5) with some appropriate $K > 0$ and $A > 0$. This follows from Lemma 18 relations (8.17), (8.23)' the definition $M = \sqrt{T / a_1}$ and (2.8)'. (Observe
that \[ \left| \frac{d}{dx} \exp \left( - \frac{a_0 c^n}{2T} (x^2 - \bar{M}^2) \right) \right| < K c^n \text{ for } x > \bar{M}. \]

Given some \( x > \bar{M} \) define \( z = z(x, n) = \frac{1}{2K} e^{-2n} \exp \{ AM^2 \mid x - \bar{M} \mid c^n \} \overline{p}_n(x, T) \), where the constants \( K \) and \( A \) are the same as in relation (9.5). Then we have by (9.5)

\[ \overline{p}_n(y, T) \geq \overline{p}_n(x, T) - z \sup_{x \leq \xi < x + z} \left| \frac{d}{dz} \overline{p}_n(\xi, T) \right| > \frac{1}{2} \overline{p}_n(x, T) \text{ for } x < y < x + z. \] (9.6)

If \( x > \bar{M} + e^{1/n} c^{-n} \) then relations (9.3) and (9.6) imply that

\[ C q^n > \int_{x + z}^{x + z} \overline{p}_n(y, T) dy \geq \frac{1}{2} z \overline{p}_n(x, T) \]

or equivalently

\[ \overline{p}_n(x, T)^2 < 2K c^{2n} C q^n \exp \{ - AM \overline{q} (c^n \mid x - \bar{M} \mid) \overline{z} \}. \]

The last inequality implies the corollary with \( \sqrt{q} \) instead of \( q \).

10. THE PROOF OF LEMMAS 17 AND 18

Proof of Lemma 17. — We use the fact that \( g_1(x) \) is the density function of the random variable \( z \) defined in (7.2). Introduce \( \eta_k = - \frac{1}{2} \left( \frac{c}{2} \right)^{k+1} \sum_{j=1}^{2^k} (1 - \eta^{2}_{j,k}) \). \( \zeta_k = z - \eta_k, \) \( k = 0, 1, 2, \ldots \) where \( \eta_{j,k} \) are the same as in (7.2).

Let \( p_k(x) \) denote the density function of \( \eta_k \) and \( F_k(x) \) the distribution function of \( \zeta_k \).

Since

\[ E \zeta^2_k \leq E \zeta^2 = A^2 \quad \text{with} \quad A = \frac{c}{2 \sqrt{2 - c^2}} P(\mid \zeta_k \mid > 2A) \leq \frac{1}{4} \quad \text{for all } k, \]

and since

\[ g_1(x) = \int_{2A}^{2A} p_k(x - y) F_k(dy) \geq \int_{-2A}^{-2A} p_k(x - y) F_k(dy) \geq \inf_{\mid x - y \mid < 2A} p_k(y) P(\mid \zeta_k \mid < 2A) \]

we have

\[ g_1(x) \geq \frac{3}{4} \inf_{\mid x - y \mid < 2A} p_k(y) \text{ for arbitrary } x \text{ and } k. \quad (10.1) \]

In order to estimate \( p_k(y) \) we recall that the local large deviation theorem for partial sums of independent identically distributed random variables implies the following estimate: If \( P_n(y) \) denotes the density function of

the random variable \( \sum_{j=1}^{n} (1 - \eta_j^2) \), where \( \eta_j \) are independent standard normal random variables then there exist some \( B > 0, \gamma > 0, C > 0 \) such that
\[
P_n(y) > \frac{C}{\sqrt{n}} \exp \left( - \frac{B}{n} y^2 \right) \quad \text{if} \quad |y| < n\gamma. \tag{10.2}
\]

Let us first consider the case \( x > 4A, x > \gamma \), and define the integer \( k = k(x) \) by the relation \( \gamma \frac{\gamma}{2} c^{k-1} \leq x < \frac{\gamma}{2} c^k \), where \( \gamma \) is the same constant which appears in (10.2). We have \( p_k(y) = 2 \cdot \exp \left( \frac{k+1}{c} \right) \left( \frac{2}{c^2} \right)^{k+1} y \).

Hence for \( |y - x| < 2A \) and \( k = k(x) \)
\[
p_k(y) > 2\sqrt{2} \left( \frac{2}{c^2} \right)^{k+1} \exp \left\{ - 8B \left( \frac{2}{c^2} \right)^{k+1} y^2 \right\} > \overline{C} \exp \left( - \left( \frac{2}{c^2} \right)^k Bx^2 \right)
\]
with some \( \overline{C} > 0 \). This implies, because of the definition of \( k(x) \) that
\[
p_k(y) \geq \overline{C} \exp (- \overline{B} x^2) \quad \text{if} \quad |x - y| < 2A, \quad k = k(x), \quad \alpha = \frac{\log 2}{\log c} \tag{10.3}
\]
with some \( \overline{C} > 0, \overline{B} > 0 \) if \( x > \max (4A, \gamma) \). Relation (10.3) also holds for \( 0 < x < \max (4A, \gamma) \) with \( k = 0 \). Lemma 17 follows from (10.1) and (10.3).

To prove Lemma 18 first we introduce some notations. Let some \( \alpha \) be given, \( 2 \leq \alpha < \frac{\log 2}{\log c} \), and choose some \( \varepsilon = \varepsilon(\alpha, c) > 0 \) such that
\[
2c^{-\alpha} > (1 + \delta)/(1 - \varepsilon)^2, \quad \left( \frac{c^2}{2} \right)^\alpha < (1 - \varepsilon)^2. \quad \text{(Here we write} \quad \alpha \quad \text{instead of the number denoted by} \quad \bar{\alpha} \quad \text{in the previous section.}) \quad \text{Define the sequence} \quad \gamma_n, \quad n = 0, 1, \ldots
\]
\[
\gamma_0 = KM^{a/2}, \quad \gamma_{n+1} = (1 - \varepsilon)\gamma_n + KM^{-\alpha} \tag{10.4}
\]
with some \( K > 0 \) to be defined later. Clearly
\[
\gamma_n = (1 - \varepsilon)^n KM^{a/2} + [1 - (1 - \varepsilon)^n] - KM^{-\alpha}. \tag{10.4}'
\]
(Here \( M \) is the same number as in Theorem 1'.) Let us fix some positive integer \( N \) and real number \( C \) so that Proposition 3 hold for large \( M_0 \) with these parameters. Define \( \beta_n \) by (3.9) and (3.9)' for \( n \geq N \) and let \( \beta_n = \left( \frac{c^2}{2} \right)^n \) for \( n < N \). We shall prove the following

Annales de l’Institut Henri Poincaré - Physique théorique
LEMMA 18'. — If \( \hat{M}_0 \) and also (in dependence on \( c, \alpha \) and \( \varepsilon \)) the number \( K \) defined in (10.4) are sufficiently large, \( 2 \leq \alpha < \min \left( 4, \frac{\log 2}{\log c} \right) \) then
\[
\left| \frac{d^j}{dx^j} f_n(x) \right| \leq \frac{C}{\beta_n^{(j+1)/2}} \exp \left( -\frac{x^2}{\gamma_n} \right) \quad \text{for } x > 0, \quad j = 0, 1 \tag{10.5}
\]
where \( C \) is the same constant as in Proposition 3.

Lemma 18 is an immediate consequence of Lemma 18' since by (10.4)'
\[\gamma_n > \text{const } M^{-\alpha} \] and also \( \beta_n > \text{const } \frac{1}{M} \) for sufficiently large \( n \). We shall prove Lemma 18' with the help of the following

LEMMA 19. — Let some \( \alpha, 2 < \alpha \leq \frac{\log 2}{\log c} \), be given, and define the sequence \( \gamma_n \) by (10.4). If \( \hat{M}_0 \) is sufficiently large, and the function \( f_n \) satisfies the inequality
\[
\left| \frac{d^j}{dx^j} f_n(x) \right| \leq \frac{C}{\beta_n^{(j+1)/2}} \exp \left( -\frac{x^2}{\gamma_n} \right) \quad \text{for } x > 0, \quad j = 0, 1
\]
with the same constant \( C > 0 \) as in Proposition 3 then
\[
\left| \frac{d^j}{dx^j} Q_{n,M_n} f_n(x) \right| \leq C_1 \frac{C^{2\gamma_n^{1/\alpha}}}{\beta_n^{(j+1)/2}} \exp \left( -\frac{2x^2}{c^{\gamma_n}} \right) \quad \text{for } x > 0, \quad j = 0, 1, \tag{10.7}
\]
where \( C_1 \) is an absolute constant. (Especially, it does not depend on the number \( K \) in the definition of \( \gamma_n \).)

Proof of Lemma 18' with the help of Lemma 19. — Relation (10.5) holds for \( n = 0 \). Indeed, we have an explicit expression for \( f_0(x) \) with implies that \( f_0(x) \leq \exp \left( -\frac{1}{16 M^2} \right) \leq 3 \exp \left( -\frac{x}{2\sqrt{M}} \right) \leq C \exp \left( -\frac{x}{\gamma_0} \right) \) if \( K \geq 16 \). The derivative \( \frac{df_0}{dx} \) can be estimated similarly.

If \( 0 < x < \frac{(2\gamma_n)^{1/(\alpha-1)}}{\beta_n^{1/(\alpha-1)}} = B_n \) then by Property 1(n)
\[
\left| \frac{d^j}{dx^j} f_n(x) \right| \leq \frac{C}{\beta_n^{(j+1)/2}} \exp \left( -\frac{2x}{\sqrt{\beta}} \right) \leq \frac{C}{\beta_n^{(j+1)/2}} \exp \left( -\frac{x^2}{\gamma_n} \right),
\]
therefore it is enough to prove (10.5) for \( x > B_n \) with the help of (10.7). We show at the end of the proof that for arbitrary large \( L > 0 \) there is some \( K = K(\varepsilon, \alpha, c) \) such that
\[
\frac{\beta_n^{2/2}}{2\gamma_n} < \frac{1}{L} \quad \text{for all } n \tag{10.8}
\]
if $\gamma_n$ is defined with this $K$. Now we prove Lemma 17 if (10.8) holds with a sufficiently large $L$. In that case we have by (3.12)

$$|M_{n+1} - M_n| < R e^{-n}\sqrt{\beta_{n+1}} = e^{-n} RB_{n+1} \left( \frac{\beta^2_{n+1}}{2\gamma_{n+1}} \right)^{1/2 - 1/2} < RB_{n+1} \left( \frac{1}{L} \right)^{1/2 - 1/2},$$

and for $x > B_{n+1}$, $|x + M_{n+1} - M_n|^2 > \left( 1 - \frac{\epsilon}{2} \right)x^2 - C(\epsilon)|M_n - M_{n+1}|^2 > (1 - \epsilon)x^2$.

Hence by (10.7)

$$\left| \frac{d^j}{dx^j} f_{n+1}(x) \right| < C_1 \frac{C^2_{j+1/2} \gamma_{n+1}}{\beta_{n+1}^{j+1/2}} \exp \left( -2 \frac{|x + M_{n+1} - M_n|^2}{\epsilon^2 \gamma_{n+1}} \right) \leq C_2 \frac{C^2_{j+1/2} \gamma_{n+1}}{\beta_{n+1}^{j+1/2}} \exp \left\{ - (1 - \epsilon)^2 \frac{2x^2}{\epsilon^2 \gamma_{n+1}} \right\} \quad \text{if } x > B_{n+1}.$$

Here we have exploited that $\gamma_{n+1} > (1 - \epsilon)\gamma_n$ and $\beta_n > \frac{1}{3} \beta_{n+1}$. Since $(1 - \epsilon)^2 2e^{-\epsilon} > 1 + \epsilon$ the last relation implies that

$$\left| \frac{d^j}{dx^j} f_{n+1}(x) \right| < A_n \exp \left( - \frac{x^2}{\gamma_{n+1}} \right) \quad \text{for } x > B_{n+1}$$

with

$$A_n = C_1 \frac{C^2_{j+1/2} \gamma_{n+1}}{\beta_{n+1}^{j+1/2}} \exp \left( - \frac{\beta_{n+1}^2}{\gamma_{n+1}} \right).$$

Simple calculation shows that

$$A_n < \frac{C_2 C^2}{\beta_{n+1}^{(j+1)/2}} \left( \frac{\gamma_{n+1}}{\beta_{n+1}} \right)^{1/2} \left( \frac{\gamma_{n+1}}{\beta_{n+1}} \right)^{(2^2 - 1)/2} < C_3 \frac{C^2}{\beta_{n+1}^{(j+1)/2}} \frac{1}{L} < C \beta_{n+1}^{-(j+1)/2}$$

if $L$ is sufficiently large. Hence it is enough to demonstrate (10.8) to complete the proof of Lemma 18'.

We have $\beta_n < B^2 \left( \frac{\epsilon^2}{2} + \frac{1}{M^2} \right)$, hence $\beta_{n+2}^2 < B \left[ \left( \frac{\epsilon^2}{2} + \frac{1}{M^2} \right)^{n+2} \right]$ with some $B = B(\epsilon)$ and $B = B(\epsilon)$. Since $(\frac{\epsilon^2}{2})^n < (1 - \epsilon)^2$ we have

$$\beta_{n+2}^2 < B \left( (1 - \epsilon)^n + M^{-2} \right).$$

On the other hand by (10.4)

$$\gamma_n = (1 - \epsilon)^n KM_{n+2} + [(1 - (1 - \epsilon)^n) \frac{K}{\epsilon M^2} \geq K \left( (1 - \epsilon)^n + \frac{1}{M^2} \right),$$

and these relations imply (10.8) if $K > BL$.
Proof of Lemma 19. — Let us introduce the functions

\[ P_n(x, u) = \int e^{-\frac{u^2}{c^2}} f_n(l_{n,n,n}(x, u, v)) f_n(l_{n,n,n}(x, u, v)) dv \]

and

\[ P_n(x) = P_n(x, 0), \]

where the functions \( l_{n,n,n}^\pm \) are defined in (4.7). Then

\[ \overline{Q}_{n,n,n} f_n(x) = 2 \int_0^\infty \exp \left( -\frac{u^2}{c^2} \right) P_n(x, u) du, \tag{10.9} \]

and by the Cauchy-Schwartz inequality

\[ P_n(x, u) \leq \left[ P_n(x + cu) P_n(x - cu) \right]^{1/2}. \tag{10.10} \]

On the other hand

\[ P_n(x) = \int e^{-\frac{u^2}{c^2}} f_n(l_{n,n,n}(x, 0, v)) dv \leq \int e^{-\frac{u^2}{c^2}} \frac{c^2}{\beta_n} \exp \left( -\frac{2x^2}{c^2\gamma_n} \right) dv = \]

\[ = \frac{c^2}{\beta_n} \sqrt{\pi} \exp \left( -\frac{2x^2}{c^2\gamma_n} \right) \text{ for } x > 0, \tag{10.11} \]

since in this case \( l_{n,n,n}(x, 0, v) \geq l_{n,n,n}(x, 0, 0) = \frac{x}{c} \), and

\[ P_n(x) \leq \frac{c^2}{\beta_n} \sqrt{\pi} \text{ for all } x \tag{10.11}' \]

since \( f_n(z) < \frac{C}{\sqrt{\beta_n}} \) for all \( z \).

It follows from (10.10), (10.11) and (10.11)' that

\[ P_n(x, u) \leq \frac{c^2}{\beta_n} \sqrt{\pi} \exp \left\{ -\frac{|x + cu|^2}{c^2\gamma_n} - \frac{|x - cu|^2}{c^2\gamma_n} \right\} \text{ for } 0 < u < \frac{x}{c} \]

and

\[ P_n(x, u) \leq \frac{c^2}{\beta_n} \sqrt{\pi} \exp \left\{ -\frac{|x + cu|^2}{c^2\gamma_n} \right\} \text{ for } u > \frac{x}{c} > 0. \]

Hence by (10.9)

\[ \overline{Q}_{n,n,n} f_n(x) \leq 2 \frac{c^2}{\beta_n} \sqrt{\pi} \left[ \int_0^{x/c} \exp \left( -\frac{|x + cu|^2}{\gamma_n c^2} - \frac{|x - cu|^2}{\gamma_n c^2} \right) du + \right. \]

\[ + \left. \left[ \int_{x/c}^{\infty} \exp \left( -\frac{|x + cu|^2}{\gamma_n c^2} \right) du \right] = 2\sqrt{\pi} \frac{c^2}{\beta_n} (I_1 + I_2) \tag{10.12} \]

To estimate \( I_1 \) we show that

\[ |x + cu|^2 + |x - cu|^2 \geq 2 |x|^2 + |cu|^2 \text{ if } x > 0, \alpha \geq 2. \tag{10.13} \]
Indeed, (10.13) is equivalent to the inequality
\[ h(u) = |1 + u|^a + |1 - u|^a - 2 - |u|^a \geq 0, \]
and this inequality holds, since \( h(0) = 0, h'(0) = 0 \) and
\[ h''(u) = a(a - 1) \{ |u + 1|^{a-2} + |u - 1|^{a-2} - |u|^a \} \geq 0. \]

By (1.13)
\[ I_1 \leq \int_0^{x/c} \exp \left\{ - \frac{2x^a}{c^a \gamma_n} - \frac{u^a}{\gamma_n} \right\} du \leq K \exp \left( - \frac{2x^a}{c^a \gamma_n} \right). \quad (10.14) \]

On the other hand
\[ I_2 \leq \int_{x/c}^\infty \exp \left( - \frac{|x + cu|^a}{\gamma_n c^a} \right) du = \gamma_n^{1/a} \int_{x/c}^\infty \exp \left( - u^a \right) du \leq \]
\[ \leq K \gamma_n^{1/a} \exp \left( - \frac{2x^a}{c^a \gamma_n} \right) \leq K \gamma_n^{1/a} \exp \left( - \frac{2x^a}{c^a \gamma_n} \right). \quad (10.15) \]

Relations (10.12), (10.14) and (10.15) together imply Lemma 19 for \( j = 0 \). The proof for \( j = 1 \) is similar. The difference is that in the estimation of \( \frac{d}{dx} Q_{n,M_n} f_n(x) \) we have to work beside the function \( P_n(x) \) also with
\[ P_n(x) = \int e^{-v^2} f_n'(l_{n,M_n}(x,0,v))^2 dv. \]

It can be estimated in the same way as \( P_n(x) \), the only difference is that now a multiplicative factor \( \frac{1}{\beta_n} \) appears. Lemma 19 is proved.
APPENDIX A

THE PROOF OF THE BASIC RECURSIVE RELATIONS (2.1) AND (2.1') IN PART I

Formula (2.1)' immediately follows from (1.4) in Part I with \( n = 0 \). To prove (2.1) let us first observe that the recursive relation

\[
(\text{A1}) \mathcal{H}_{n+1}(x_1, \ldots, x_{2^n+1}) = \mathcal{H}_n(x_1, \ldots, x_{2^n}) + \mathcal{H}_n(x_{2^n+1}, \ldots, x_{2^{n+1}}) - e^\theta \left( 2^{-n} \sum_{i=1}^{2^n} x_i \right) \left( 2^{-n} \sum_{j=2^n+1}^{2^{n+1}} x_j \right)
\]

holds for \( n \geq 0 \), where

\[
\mathcal{H}_n(x_1, \ldots, x_{2^n}) = - \sum_{i=1}^{2^n} \sum_{j=i+1}^{2^n} U(i, j)x_ix_j,
\]

and \( U(i, j) \) is defined by (1.1) and (1.2)' in Part I. By relation (1.4) in Part I.

(\text{A2}) \[ p_{n+1}(x, T) = \frac{1}{Z_{n+1}(T, t)} \exp \left\{ - \frac{1}{T} \mathcal{H}_n(x_1, \ldots, x_{2^n+1}) \right\} \delta \left( 2^{-(n+1)} \sum_{i=1}^{2^{n+1}} x_i - x \right) \prod_{i=1}^{2^{n+1}} p(x_i)dx_i,
\]

where \( Z_{n+1}(T, t) \) is an appropriate norming constant, and \( \delta(2^{-(n+1)} \sum_{i=1}^{2^{n+1}} x_i - x) \) means that integration in (A2) is taken on the hyperplane \( 2^{-(n+1)} \sum_{i=1}^{2^{n+1}} x_i = x \) with respect to the Lebesgue measure. Let us fix some number \( u \), and calculate the integral on the right-hand side of (A2) by integrating first on the hyperplane defined by the relations \( 2^{-n} \sum_{i=1}^{2^n} x_i = x + u \) and \( 2^{-n} \sum_{i=2^n+1}^{2^{n+1}} x_i = x - u \) and then by integrating by \( u \). We get with the help of relations (A1) and (A2) that

\[
p_n(x, T) = \frac{1}{Z_{n+1}(T, t)} \exp \left\{ \frac{e^\theta}{T} (x + u)(x - u) \right\} \left[ \int \exp \left\{ - \frac{1}{T} \mathcal{H}_n(x_1, \ldots, x_{2^n}) \right\} \delta \left( 2^{-n} \sum_{i=1}^{2^n} x_i - (x + u) \right) \prod_{i=1}^{2^n} p(x_i)dx_i \right] \]

\[
\left[ \int \exp \left\{ - \frac{1}{T} \mathcal{H}_n(x_{2^n+1}, \ldots, x_{2^{n+1}}) \right\} \delta \left( 2^{-(n+1)} \sum_{i=2^n+1}^{2^{n+1}} x_i - (x - u) \right) \prod_{i=2^n+1}^{2^{n+1}} p(x_i)dx_i \right] du =
\]

\[
= C_n \int \exp \left\{ \frac{e^\theta}{T} \left( x^2 - u^2 \right) \right\} p_n(x + u)p_n(x - u)du,
\]

as we have have claimed.

(Manuscrit reçu le 20 mars 1988)
